SECOND DAY

VOLUME 4

Pages 439 through 543

PROCEEDINGS:

HEARING

BEFORE:

COMMISSIONER J. TERRY DEASON  
 COMMISSIONER JULIA L. JOHNSON  
 COMMISSIONER DIANE K. KIESLING

DATE:

Thursday, March 9, 1995

TIME:

Commenced at 9:30 a.m.  
 Concluded at 1:00 p.m.

PLACE:

Fletcher Building  
 FPSC Hearing Room 106  
 101 East Gaines Street  
 Tallahassee, Florida

REPORTED BY:

JOY KELLY, CSR, RPR  
 Chief, Bureau of Reporting  
 SYDNEY C. SILVA, CSR, RPR  
 Official Commission Reporters

FLORIDA PUBLIC SERVICE COMMISSION DOCUMENT NUMBER-DATE

02811 MAR 15 95

FPSC-RECORDS/REPORTING

1 APPEARANCES:

2 (As heretofore noted.)

3  
4 ALSO PRESENT:

5 BILL BERG, FPSC Division of Electric and Gas

6 ROBERTA BASS, FPSC Division of Electric and Gas

7 KENNETH DUDLEY, FPSC Division of Electric and Gas

## P R O C E E D I N G S

(Hearing reconvened at 9:35 a.m.)

(Transcript follows in sequence from Volume  
3.)

COMMISSIONER DEASON: Call the hearing back to  
order.

Ms. Brown, I believe we're at the stage where  
we can have closing argument, and then we can entertain  
Staff's recommendation on those pending issues.

MS. BROWN: Yes, Commissioner. We have Issue  
10A, 10B and 10C and TECO's Issue 23A.

COMMISSIONER DEASON: Let me ask, did we  
dispose of all of the other issues in the 01 docket?

MS. BROWN: Yes, I believe we did yesterday.

COMMISSIONER DEASON: We just have the four  
outstanding issues and any effects on fallout  
calculations.

MS. BROWN: Subject to the fallout, that's  
right.

COMMISSIONER DEASON: Okay. We're going to  
have closing argument, and I believe ten minutes for  
each party would be ample. So I'm going to ask you to  
keep your argument limited to ten minutes. And Mr.  
Childs we'll begin with you.

MR. CHILDS: Commissioners, the first issue I

1 wish to address is 10A, having to do with the allocation  
2 method being proposed by Florida Power and Light Company  
3 for the recovery of fuel cost.

4 I think you heard in the testimony that the  
5 cost of fuel increases and decreases as the level of  
6 generation increases and decreases from one hour to the  
7 next. And this increase and decrease is both as to the  
8 total cost of fuel for that hour, the average unit cost,  
9 that is in per-kilowatt-hour basis, and also the  
10 incremental cost. In other words, as you move up the  
11 economic dispatch curve, you see successively more  
12 expensive units being used.

13 The allocation method that is proposed by FPL  
14 in this proceeding is consistent with the way that  
15 capacity costs are allocated in base rate proceedings.

16 In base rate proceedings, as the Staff  
17 question established, approximately 92% of the capacity  
18 costs are allocated to customer classes in proportion to  
19 the customer class contribution to the 12 monthly peaks.  
20 And all that means is that if a class has 50% of the  
21 peak demand, then that class is allocated 50% of the  
22 capacity cost because they have contributed to 50% of  
23 the peak demand.

24 A class that has 10% of contribution to peak  
25 demand gets roughly 10%. And I say the 10% to 50% in my

1 example recognizing I'm only talking about 92% of the  
2 total allocation methodology.

3           One of the issues that's been brought up, I  
4 think, through questioning and through the Staff  
5 position, is the suggestion that there's an inverse  
6 relationship between the capital costs and the fuel  
7 costs for a generating unit; or stated differently, that  
8 generating units that cost a lot to build in capital are  
9 typically thought to have lower fuel costs. I think we  
10 heard from Mr. Birkett that that may be true some of the  
11 time, but that's somewhat of a simplification.

12           I'm suggesting to you that it doesn't make any  
13 difference, because when you are allocating costs, what  
14 you're doing is allocating the costs of all units. You  
15 don't just allocate the cost of the most expensive  
16 generating units when you are allocating capacity cost  
17 responsibility, you're allocating the cost of the least  
18 expensive, and, therefore, covering the whole spectrum  
19 of the generating capacity available. This allocation  
20 is proportional as we've just gone through; proportional  
21 to the contribution to peak demand.

22           Now, on the other hand, when you are  
23 allocating fuel costs, all that's being proposed is to  
24 recognize, I think, the very similar proposition; that  
25 is, that in hours where the total average cost and the

1 unit cost is high, the class that contributes to that  
2 should be allocated a share in proportion to their  
3 contribution. So that if in peak periods they have used  
4 50% of the energy in that peak period, then they ought  
5 to get 50% of the cost. In an off-peak period if they  
6 have contributed 20%, then they ought to get 20% of the  
7 costs allocated in a fashion that is in proportion to  
8 their usage.

9 I think there is this increase in costs. I  
10 think it's well recognized and that's the reason that  
11 this Commission expects all utilities to use, to the  
12 extent possible, economic dispatch when they run their  
13 units. You run the cheapest unit first unless there is  
14 something having to do with system reliability or  
15 availability of your units that prevent you from doing  
16 that.

17 Therefore, when we're allocating all costs to  
18 all customers, it seems to us that it's fair to  
19 recognize that there are differences in cost causation  
20 by customer classes in the contribution to both fuel  
21 costs and capacity costs.

22 Very briefly I want to move to plant  
23 modifications. I think the evidence shows that the  
24 estimated cost is approximately 2.8 million; that the  
25 savings that are estimated for the upcoming six-month

1 period are approximately 8.3 million, so that the  
2 savings are already, from that six-month period, in  
3 excess of the cost; and that the estimated savings  
4 through the next five years is approximately  
5 \$80 million. That is, for the expenditure of about 2.8,  
6 there is this potential savings in fuel costs, and we  
7 believe that your order suggested to the companies that  
8 you had not exhausted the possibility for fuel cost  
9 recovery, and if there was an alternative available that  
10 the companies thought was appropriate, they should bring  
11 it to your attention. We did just that and we think  
12 that it's a very beneficial project that helps the  
13 customer and it has significant benefits that are far in  
14 excess of the costs that we're seeking to recover, even  
15 in the six-month period.

16           The last issue I want to move to is the issue  
17 having to do with the estimated cost of natural gas.

18           I'd like to remind the Commission that when we  
19 file estimates in the fuel adjustment proceeding, it is  
20 not simply a -- we have a hearing every six months, come  
21 put your case on the table and let people look at it.  
22 There's more to it than that. There's a procedure that  
23 the Commission established -- I don't know, 12, 13, 14  
24 years ago which had not only a comprehensive list of  
25 forms but filing schedules, so a lot of detail had to be

1 presented. And the estimation process was intended by  
2 the Commission to be consistent because there were --  
3 when you are making a forecast of consumption for a  
4 period, you want to look at economic conditions just as  
5 you want to look at economic conditions when you're  
6 attempting to forecast fuel costs.

7           Those comprehensive forms -- and this is one  
8 part of what we file with the testimony and the forms --  
9 has been used for many years. The Commission has a  
10 comprehensive procedure both for the estimation and the  
11 establishment of the fuel adjustment charge; the  
12 midcourse change, that is the filing halfway through a  
13 period with the results of two months of actual and a  
14 reestimate for the remaining four months, which is then  
15 used to quantify a variance so that that variance, if  
16 any, can be picked up in time to be implemented in the  
17 next six-month period. Then when we file our  
18 projection. We pick up not only that, but we pick up --  
19 pick up is a bad term -- we reflect in our calculation  
20 of total cost not only the changes that I just described  
21 in the two-months actual, four-months estimate, but we  
22 reflect as well the final true-up from the prior period.

23           In addition, the Commission has recognized,  
24 and we have had a number of proceedings where the  
25 Commission has given directions to the utilities about

1 when they should come in for midcourse corrections and  
2 what was the standard. And one of the things that the  
3 Commission recognized in talking about the standard,  
4 which was generally in the area of 10%, that the utility  
5 at least had to notify the Commission if you were at  
6 that level. And if you were approaching 10% or in  
7 excess of it, you needed, as a utility, to request a  
8 change.

9           The Commission also recognized, when it said  
10 that the utilities need to request a change, that it was  
11 important to look at the period remaining in the  
12 six-month period for the fuel factor. In other words,  
13 if you had only one month left in the period, the  
14 Commission said it didn't make much sense to have a  
15 midcourse correction with only one month left. You come  
16 back the next six-month period.

17           The reason for all of that summary to you of  
18 the procedures is that it is a comprehensive process  
19 that the Commission has implemented, and I think that  
20 the comprehensive process is attempting to recognize  
21 that fuel costs are volatile, but as well other impacts  
22 are felt in the factor, such as consumption levels that  
23 are different from what are estimated, and that dealing  
24 with an estimate in the first place -- as we are here  
25 today on this issue -- dealing with an estimate of the

1 future fuel adjustment factor that the Commission will,  
2 and has the procedures in place, to address an error, if  
3 significant enough, to warrant changing the factor.

4 Now, Florida Power and Light believes that its  
5 estimate is a reasonable one. I think the evidence  
6 established that as to the material that's been filed  
7 with you by other companies, as to their estimate of gas  
8 prices for the next period, that we are, if not lowest,  
9 among the lowest.

10 COMMISSIONER KIESLING: Let me ask you a  
11 question just so I'm clear.

12 This 10% threshold for coming in and getting a  
13 correction, is that 10% total fuel expenditures or is  
14 that specific to each fuel type?

15 MR. CHILDS: It's total.

16 COMMISSIONER KIESLING: Okay.

17 MR. CHILDS: And that's one of the reasons as  
18 we talk here about gas prices, and one of the reasons,  
19 although you were shown some information about the error  
20 between -- although I don't agree it's in error -- but  
21 the difference between the estimate and the actual  
22 natural gas price for some prior periods, when counsel  
23 for Florida Steel showed some of the A schedules. The  
24 reason I showed one of the other schedules for the most  
25 current six-month period to reflect that even with those

1 variances between the estimated price of natural gas and  
2 the actual price, that the ultimate error for the period  
3 was 1.3%.

4 Our point is that although we think our  
5 estimate is reasonable, we also realize that we're  
6 dealing with estimates and that it's a complex mix of  
7 many components that affects the bottom line of total  
8 costs and whether the factor needs to be changed. We  
9 don't think it does.

10 And we thank you.

11 COMMISSIONER DEASON: Mr. Beasley.

12 MR. BEASLEY: I'm not involved in that matter.  
13 We have the Tampa Electric issue.

14 COMMISSIONER DEASON: We're going to hear  
15 argument on all issues and then Staff will give its  
16 recommendation. If you have a position you want to  
17 argue on any pending issue, now is your opportunity.

18 MS. BROWN: Commissioner, I was just wondering  
19 if it would not be appropriate to hear all of the  
20 argument on Florida Power and Light's issues first, and  
21 then go to TECO's for your sake, to get the full  
22 perspective on --

23 COMMISSIONER DEASON: There's not that many  
24 issues. I can keep them straight. I'd like to get the  
25 arguments finished and then we can go into the stage of

1 recommendations, and then we can go into the stage of  
2 vote and we'll be finished.

3 Mr. Beasley, you may proceed.

4 MR. BEASLEY: Yes, sir.

5 Commissioner, my issue goes to Issue 23A,  
6 which was the option payment, the \$1.1 million amount  
7 which Tampa Electric negotiated in its contract  
8 modifications with Polk Power Partners.

9 In January this Commission approved the  
10 contract modifications which Tampa Electric and Polk  
11 Power Partners had agreed to. In doing so, you found  
12 that it would be beneficial to Tampa Electric Company's  
13 ratepayers. And Mr. Mestas you heard yesterday and in  
14 the prior proceeding testified that this will produce up  
15 to \$4.5 million in fuel savings for Tampa Electric's  
16 customers.

17 When Polk Power Partners came to Tampa  
18 Electric seeking certain contract modifications, the two  
19 discussed various alternatives to accomplish what it was  
20 that Polk wanted to do. Tampa Electric negotiated its  
21 best deal and brought it to the Commission; it was  
22 approved and in the process it was determined that it  
23 would produce up to \$4.5 million in fuel savings. The  
24 Company also exacted in that negotiating process a  
25 \$1.1 million one-time option payment, which it booked

1 above the line to other electric revenues, which is a  
2 common account for incidental revenues that are derived  
3 in various means through contract work through sale of  
4 spare parts and other nontypical transactions.

5           This compensation was totally transparent to  
6 Tampa Electric Company's customers. The changes that  
7 were made were totally risk-free to Tampa Electric  
8 Company's customers. The cogeneration agreement, the  
9 standard offer contract that Tampa Electric had  
10 previously entered into, the obligations and the  
11 benefits to the customers remain totally unchanged as a  
12 result of the contract modifications that the Commission  
13 approved.

14           The point here is that the \$1.1 million other  
15 electric revenue above-the-line payment was totally  
16 unrelated to energy or capacity payments under the  
17 contract. There had been no early capacity payments, as  
18 Mr. Mestas testified yesterday, that were refunded.  
19 There was actually no funds had ever changed hands back  
20 in September or October of 1993 when this one-time  
21 payment was made. Mr. Mestas also testified that the  
22 energy and capacity payments began in January of 1995;  
23 they were negotiated consistent with that agreement,  
24 exactly unchanged from what they had originally been  
25 agreed to. The \$1.1 million is totally unconnected with

1 capacity payments.

2           They were booked above the line as "other  
3 electric revenues", which is a common account. I mean  
4 it's a standard account that utilities use. And as an  
5 analogy, if Polk Power Partners had come to Tampa  
6 Electric and said, "We have this transformer and we  
7 don't know exactly how to install it. Would you do it  
8 for us at cost?" And if Tampa Electric said -- or they  
9 had the people available to do that, they would have  
10 agreed to install it and charge them their cost for  
11 installing it, and that would have been booked to "other  
12 electric revenues." Now the question is what do "other  
13 electric revenues" do?

14           Well, they are like any other revenues that a  
15 utility company earns; they help defray the revenue  
16 requirement that would otherwise have to be made up by  
17 the general body of ratepayers of the utility. So in  
18 this respect the \$1.1 million benefits Tampa Electric's  
19 customers by making a contribution towards the Company's  
20 overall revenue requirement. And as you're well aware,  
21 the utility is authorized to earn within a range around  
22 the midpoint of a return. If they're somewhere in that  
23 range, the regulatory model encourages them to earn  
24 every extra dollar they can and to reduce every dollar  
25 of expense they can, and hopefully better their stature

1 within that range. If they're really efficient and have  
2 good revenues, they could wind up above the range and be  
3 in an overearning situation, or if they are lacking in  
4 their efforts, and, you know, do not take advantage of  
5 every opportunity, they could wind up being in an  
6 underearning situation; below the bottom of the range.

7 But the Commission for many, many years has  
8 encouraged utilities to be efficient when you can, to  
9 save every dollar of expense that you can, and also to  
10 go after these revenues in order to improve their  
11 position within that range.

12 The point is that other electric revenues,  
13 like any other revenues that a utility earns, help  
14 offset and defray the need for rate increases to the  
15 general body of ratepayers. That's exactly what this  
16 \$1.1 million does, in addition to the up to \$4.5 million  
17 in fuel savings that these contract modifications made  
18 available to Tampa Electric's customers.

19 Mr. Mestas also told you yesterday that the  
20 Company's alternative to negotiating this \$1.1 million  
21 option payment was to construct a temporary interchange  
22 facility to the Orange cogeneration site, which would  
23 have cost approximately \$2 million; roughly twice the  
24 amount of the option payment.

25 This would have been booked -- would have been

1 charged to the customer and booked to CIAC, and not one  
2 dollar of that amount would have been flowed through the  
3 capacity cost recovery clause factor. I don't think the  
4 Staff would even suggest that, or Public Counsel.

5           So instead of doing that, though, the Company  
6 chose a more economic alternative to all parties  
7 involved: They negotiated the \$1.1 million payment as  
8 opposed to \$2 million. That was better for the  
9 cogenerator, it was better for Tampa Electric and it was  
10 better for the general economy because money was not  
11 spent that didn't need to be spent.

12           The point I would like to make in that regard  
13 is we think that Tampa Electric should not be penalized  
14 for having made a more economic decision and negotiated  
15 a better deal for everyone involved than building a  
16 \$2 million temporary facility at a much higher expense.

17           The Staff's position on this issue speaks in  
18 terms of risk. Again, the changes that were made were  
19 totally risk-free to Tampa Electric's customers. The  
20 obligation of the cogenerator is the same as it was  
21 before. There's no change in that regard.

22           The original agreement, as Mr. Mestas  
23 indicated to you yesterday, was discounted down to 80%  
24 of full avoided cost to fully compensate the utility  
25 customer, Tampa Electric's customers, for any perceived

1 risk. There were no early capacity payments involved in  
2 this matter. There were none to be recovered. The  
3 \$1.1 million option payment was not a refund of anything  
4 that the ratepayers of Tampa Electric had previously  
5 been asked to pay.

6           As you found in your order approving the  
7 modifications, Tampa Electric's customers are better off  
8 today than they were prior to these contract  
9 modifications. So as a bottom line I would ask you not  
10 to sweep these noncapacity related, other electric  
11 revenues into the capacity cost recovery clause as a  
12 credit any more than you would if Tampa Electric had  
13 gone out and installed a transformer or sold electricity  
14 to a cogenerator, or done anything else that would have  
15 produced revenues that are not capacity cost recovery  
16 clause related. We ask you not to penalize Tampa  
17 Electric for negotiating a good deal that benefitted its  
18 customers.

19           Thank you.

20           COMMISSIONER DEASON: Mr. Kaufmann.

21           MR. KAUFMANN: Commissioners, I understand in  
22 general that it's not usual for an industry acting alone  
23 to intervene in one of these matters, so I just wanted  
24 to go just for a couple of minutes to explain why I'm  
25 here and why Florida Steel is in this case.

1 Florida Steel, as you know from our petition,  
2 operates a steel recycling and manufacturing plant in  
3 Jacksonville, and it's what's called in the industry "a  
4 minimill," which means it uses vast quantities of  
5 electricity to melt and recycle scrap steel and to make  
6 rebarring rods, which are then sold in highly  
7 competitive markets.

8 In these markets, which are essentially  
9 commodity markets, buying decisions are driven for  
10 like-quality products based solely on price. In other  
11 words, if you have any other like-steel product, the one  
12 who is going to get the contract is the one with the  
13 lowest price. Therefore, cost and productivity  
14 advantages equal market advantages and cost  
15 disadvantages equal competitive disadvantages. If  
16 production costs are too high, including the cost of  
17 electricity, then the plant suffers and it suffers in  
18 its markets.

19 Now, this particular plant uses, as I said,  
20 vast quantities of power. It has a 45-megawatt peak  
21 load; uses 220,000 megawatt-hours per year, and it pays  
22 approximately \$8 million a year in its electric bills.  
23 So electricity is one of the top three costs of  
24 producing steel; the others being labor and the cost of  
25 the scrap itself that it recycles. And when a plant

1 pays too much for production costs, it cannot, unlike  
2 monopoly utilities, pass those costs on its customers.  
3 The customers just won't tolerate it and they'll buy  
4 from somebody else.

5           If a plant loses money, and it loses too much  
6 money, it has no other choice but to close. Florida  
7 Steel has already had experience with this in its Tampa  
8 melt shop: The cost of high production costs, including  
9 the cost of electricity, it closed last March. So  
10 businesses such as Florida Steel simply cannot afford to  
11 pay more than is necessary or more than fair for its  
12 power.

13           Now, looking specifically of the effects of  
14 this docket on Florida Steel, as I said they have an  
15 \$8 million a year electric bill of which 40% represents  
16 fuel costs. So that's approximately \$3.2 million  
17 annually that Florida Steel pays just for fuel. If we  
18 look at the period that's under consideration in this  
19 docket, 52% of the fuel clause is going to be  
20 represented by the cost of natural gas. That's a  
21 \$1.6 million annual figure to us.

22           Now, if the gas price estimate is 25% too  
23 high, than Florida Steel would wind up paying, on an  
24 annual basis, over \$400,000 more than it had to up  
25 front.

1           If you look at the FPL Schedule A3, which we  
2 discussed yesterday, over the last 13 months they have  
3 overestimated gas costs by \$92 million, and that's 25%  
4 over the estimate.

5           Now, we've heard from FPL, and again just  
6 recently, that this is difficult and we're working with  
7 estimates but not to worry about it because eventually  
8 it all works out in the wash. But a company like  
9 Florida Steel just cannot afford to pay \$400,000 a year  
10 too much because eventually its promised it will get it  
11 back. Our response is that it's not right because one,  
12 because of the timing differences and inflation, we  
13 really never get it back; we're always catching up.

14           Number two, an interest rate recovery  
15 somewhere between 5% and 6% is just not compensatory for  
16 a highly competitive business. That's not the kind of  
17 return that you can make and survive in a competitive  
18 world.

19           And finally, and most importantly, Florida  
20 Steel and the other ratepayers are not in the business  
21 of being a low interest lender to Florida Power and  
22 Light. It's just not right. It's \$400,000 a year; it's  
23 money that could be better spent on productivity, plant  
24 upgrades and Florida jobs.

25           Now, looking at the specific issues. Going to

1 Issue 10C, which are the gas price estimates, yesterday  
2 from Mr. Silva admitted from the stand, and I believe it  
3 might have even been on redirect, again I don't have the  
4 transcript so I apologize if I can't point to the  
5 specific spot -- but he did admit that today's price of  
6 gas is \$1.36 per MMBtu. Now, if you add to the \$1.36  
7 the 65 cents of transportation costs that he puts in his  
8 rebuttal testimony, you wind up with a current price of  
9 gas that should be \$2.01.

10 Now, the actual rate that FPL is asking for  
11 for in this filing is \$2.48. The difference is 47 cents  
12 or 19%. So right off the bat we're nearly approaching  
13 that 20% overage that we were at for all of last year.

14 He also admitted from the stand that current  
15 U. S. supplies for gas are even greater than anticipated  
16 when they submitted their direct testimony and greater  
17 yet again from the time that they've even submitted  
18 their rebuttal testimony. So the best that you can say  
19 about this \$2.01 conservative gas estimate is that we  
20 already know that it's too high provided current  
21 information.

22 Mr. Silva admits in his direct testimony on  
23 Page 8 that for this period of April through September  
24 1995, gas costs should essentially be the same as FPL's  
25 average 1994 price of gas. Keeping in mind he said that

1 while all current trends seem to show that it's likely  
2 that prices will continue to go down because of these  
3 large and unanticipated supplies. And he also admits  
4 this.

5           We have the independent verification from the  
6 Wall Street Journal articles, and from the future  
7 markets which confirm this downward trend. But if you  
8 leave that cost of that conservative -- and the number  
9 that we know is going to be too high, but the  
10 conservative \$2.01, you still get approximately a  
11 \$55 million overestimate of gas charges for the upcoming  
12 months period. And I apologize for getting a little  
13 technical again, if I could brief it it would be easier,  
14 but I'll go through a quick argument on how that  
15 calculation is made.

16           If you look at Appendix 2, Page 1 on Schedule  
17 E3, FPL says it's going to burn 15,917,400 MMBtu's  
18 during the April through September period. If you  
19 multiply that by the conservative \$2.01, you're paying  
20 approximately \$233 million on gas.

21           Now, the FPL estimate and what they are asking  
22 for is actually \$288 million for the same period, or  
23 \$55 million overestimate which is 19%.

24           Now, as a percent of the total fuel factor  
25 methods being asked for, that makes this number already

1 approaching or at that 10% of the total fuel case. They  
2 are asking for approximately \$545 million total. We're  
3 already at approximately a \$55 million overage on a  
4 conservative basis.

5           Mr. Childs had mentioned that he showed  
6 schedules saying when you account for the other factors,  
7 you know, the gas price, whether it may be wrong or not,  
8 it doesn't have such a big effect because it's just one  
9 of many factors. Well, for the previous six months, gas  
10 represented only 27% of the entire fuel package. For  
11 this period it's 52%; it's nearly double. So the  
12 effects you're going to have of an overestimate on gas  
13 are going to be that much greater the upcoming six  
14 months.

15           Now, everyone, including FPL, agrees that if  
16 you approach that 10% variance you require correction.  
17 If it happens midcourse, you do it midcourse. It's our  
18 position if you have good information at the start, it  
19 makes a lot more sense to get it right now than to have  
20 to catch up later instead of having the customers front  
21 the bill.

22           Now, there were arguments made by Mr. Silva on  
23 his rebuttal regarding credits, but the calculation I  
24 just described is not affected by the credits because  
25 those credits expired last year and they are not

1 effective anymore.

2           The transmission costs are not a factor  
3 because the 65 cents that I mentioned is the  
4 transmission rate Mr. Silva uses in his rebuttal. And  
5 the heat rate argument that he made is no longer a  
6 factor because the calculation I just gave you uses the  
7 quantities on an MMBtu basis from his schedule so that's  
8 not really a problem.

9           If you look at Mr. Fietek's testimony, he says  
10 we have an overestimate of \$43.6 million. The most we  
11 can say -- what we can say about that is that it's very  
12 conservative. Because if you just do a current analysis  
13 based on what Mr. Silva admitted yesterday about the  
14 current price of gas, Mr. Fietek's number is very  
15 conservative. And the reason that the overage is  
16 smaller than what I'm telling you now is because gas  
17 prices have actually dropped 13% just since the time  
18 that Mr. Fietek's admitted his testimony.

19           Now, we also have to assume, because there's  
20 no evidence to the contrary, that the remaining fuel  
21 components in the fuel case are correct because there's  
22 no evidence to challenge them by anybody. So what we're  
23 left with is an estimated \$55 million overestimate which  
24 is already at a 10% level.

25           Now, regarding Issue 10B for the \$2.8 million

1 plant improvements, the plan to expense is \$2.8 million  
2 over the fuel period asks current ratepayers to pay for  
3 capital improvements whose benefits extend well beyond  
4 the current period. Those modifications will be used  
5 and useful well into the future and we've submitted some  
6 evidence on the remaining life of those plants to show  
7 that. Under FPL scenario, today's ratepayers are going  
8 to be paying for tomorrow's ratepayers' benefits.

9           So our recommendation is that the Commission  
10 should require FPL to capitalize and depreciate the  
11 investment plant and equipment. Otherwise, Florida  
12 Steel and the other ratepayers are again winding up  
13 paying more than their fair share for their electric  
14 power. We're only asking that we and the other  
15 ratepayers be treated fairly and not be FPL's lender.

16           And we continue to hear from FPL and from  
17 Staff, to a degree, that the kind of procedures that are  
18 set up here are the ways that the Commission has been  
19 doing it for year, and that this is the way it's done  
20 and it's the best we have. Florida Steel is making a  
21 special point to say as far as it is concerned the way  
22 it's being done right now and the way it's always been  
23 done is not doing enough because we're winding up paying  
24 too much for power to have that refund; to constantly be  
25 chasing that refund that you're getting at such a low

1 interest.

2           And we believe that if there is enough  
3 evidence, and we think there is in this case, that we're  
4 already at the point of too much error in a very large  
5 component of the fuel case; that the correction ought to  
6 be made now because competitive businesses cannot afford  
7 to pay more than they need to for commodities, like  
8 electricity, particularly one like Florida Steel where  
9 electricity is such a large percentage of the cost of  
10 production.

11           Thank you.

12           COMMISSIONER DEASON: Mr. Howe.

13           MR. HOWE: Thank you, Commissioners.

14           I'd like to first address Florida Power and  
15 Light's Issue 10B, \$2.8 million spent for plant  
16 modifications.

17           Those expenditures were made over a period of  
18 approximately one year, from early 1994 to February of  
19 1995. I believe the testimony shows they've capitalized  
20 on the financial accounts of the Company. That's the  
21 appropriate treatment. That accounting will allow for a  
22 matching between the service that is provided over of  
23 the future and the investment that was recognized over  
24 the future as depreciation. Florida Power and Light has  
25 not shown any exceptional circumstances or justification

1 for effectively in the next six-month period requiring  
2 the customers through their fuel clause and fuel cost to  
3 pay for a long-term investment that is meant to provide  
4 benefits over time.

5           The fact that the customers receive the  
6 benefit, as the term is so often used by utilities, of  
7 lower fuel cost is of no significance. The utility has  
8 an obligation to provide efficient service at a  
9 reasonable cost, and in return it receives the  
10 safeguards of the regulatory compact. But the simple  
11 fact that an offshoot of the Company's decision to  
12 modify plant, to position itself to better meet  
13 competition in the future, should not be portrayed in  
14 the guise that it was all done out of altruism. The  
15 Company did it for its own business purposes. It's not  
16 too much different from General Motors lowering the  
17 prices of its cars. It might say it did it for the  
18 benefit of its consumers, but actually it was clearly  
19 for its own corporate purposes. And that's what it was  
20 for Florida Power and Light in this instance.

21           I'd like to next address Issue 23A, which is  
22 Tampa Electric Company's option payment from Polk Power  
23 Partners.

24           Mr. Mestas testified there are essentially two  
25 components of that transaction. There is a cogeneration

1 contract and Tampa Electric has obligated itself to pay  
2 capacity payments and energy payments to Polk Power  
3 Partners, which is the cogenerator. It has also  
4 negotiated a separate agreement, which it calls an  
5 option payment, which it has booked as "other electric  
6 revenues."

7           Now, Commissioners, I'm not an accountant but  
8 I think I can safely say that you don't earn revenues  
9 when you buy something. The transaction between Tampa  
10 Electric Company and Polk Power Partners has Tampa as  
11 the purchaser and Polk as the seller.

12           Mr. Beasley used some examples of such things  
13 when Tampa Electric, or an electric utility, were to  
14 install a transformer, they are the seller; they are  
15 providing electric service. If Tampa Electric -- and  
16 should properly book those receipts as other revenues.  
17 If Tampa Electric sells spare parts, it is again the  
18 seller, it is not the purchaser.

19           I think most of us would like to be in a  
20 position where every time we bought something we were  
21 receiving revenues. Essentially what you have in this  
22 transaction between Polk and Tampa Electric Company is a  
23 rebate. Polk found it in its best interest to give  
24 Tampa Electric dollars up front for a stream of revenues  
25 to Polk that would follow later in the form of capacity

1 and energy payments. It's not too much different from  
2 what you see with car manufacturers when they want to  
3 sell more cars but they don't want to change the list or  
4 selling price of their vehicles, they offer a rebate.  
5 But if you get a \$1,000 rebate up front, the fact that  
6 in the future you're going to make the same payments  
7 that you would have made if you bought the car for full  
8 list price doesn't mean your total purchase price in  
9 that transaction is not less. Clearly you are in a  
10 better position than another purchaser who did not get a  
11 rebate.

12 I would suggest that the option payment does  
13 not fall in the category of "other electric revenues"  
14 and, in fact, is not a revenue item for the simple  
15 reason that a purchase does not generate revenues.  
16 Tampa Electric can only generate revenues where it is  
17 either the seller of a product, a service, or a  
18 commodity. It received a rebate; the rebate has reduced  
19 the total cost to Tampa Electric over the life of the  
20 contract paid to Polk Power Partners. What has flowed  
21 through the capacity cost recovery clause, the fuel  
22 adjustment clause, should only be the total cost to  
23 Tampa Electric Company, which will be net of the option  
24 payment from Polk Power Partners.

25 Thank you very much.

1           COMMISSIONER DEASON: Staff.

2           MS. BROWN: Commissioner, Mr. Berg will  
3 present the recommendation on Issue 10A. Ms. Bass will  
4 present the recommendations on 10B and 10C, and Mr. Berg  
5 will present the recommendation on 23A.

6           MR. BERG: Commissioners, Issue 10A is FPL's  
7 proposed new methodology for allocating fuel cost to the  
8 various customer classes.

9           Staff recommends that the Commission deny  
10 FPL's proposed fuel allocation methodology. The  
11 proposed methodology will result in an inappropriate  
12 shifting of cost to the residential and small commercial  
13 customer classes.

14           The reason why we believe that FPL's proposal  
15 should be denied is because it fails to recognize that  
16 fuel costs are in part a function of the capital cost  
17 associated with generating units on FPL's system.

18           To illustrate the relationship between the  
19 capital cost and the fuel cost, assume that FPL had  
20 nothing but peakers on its system, they would have  
21 relatively lower capital cost but their overall fuel  
22 cost would be higher. And the converse is true: If you  
23 assume that FPL had nothing but nuclear units and coal  
24 units on their system, their capital cost would be high  
25 but their fuel cost would be lower. Because of this

1 relationship, Staff believes that the reason why fuel  
2 costs go up in periods when the system load goes up is  
3 because the plant costs that are generating those  
4 incremental units are lower. And again the converse is  
5 true. The reason why fuel costs are going down in  
6 periods of lower system load is because the plant costs  
7 are going up.

8           Consequently, we believe that if a customer  
9 class is assigned a larger portion of the fuel cost  
10 because it contributes relatively more to the peaking  
11 load hours, as FPL's proposal does, then we believe that  
12 the capital cost of those generating units should be  
13 allocated in the same fashion. FPL has not proposed to  
14 change the way it allocates its capital cost for  
15 production.

16           Consequently, Staff believes that there's  
17 currently consistency in the cost -- and the way the  
18 capital costs of FPL's generating units and the way the  
19 fuel costs are allocated to the customer classes. This  
20 methodology is employed by all of Florida's IOUs,  
21 electric IOUs, and we believe it should remain that way.  
22 Thank you.

23           COMMISSIONER DEASON: That's the  
24 recommendation for Issue 10A.

25           MR. BERG: Yes.

1           COMMISSIONER DEASON: Commissioners, do you  
2 wish to address issue-by-issue?

3           COMMISSIONER JOHNSON: Issue-by-issue.

4           COMMISSIONER DEASON: Okay.

5           COMMISSIONER JOHNSON: I think I have a  
6 question for Staff and it's some confusion for me.

7           It seemed as if FPL's argument on 10A was that  
8 the cost of fuel increases or decreases as the level of  
9 generation increases; that it's more of a direct  
10 relationship, and you all are saying it's an inverse  
11 relationship.

12           If you could respond to his initial comments  
13 regarding the cost of fuel; how the cost of fuel, if it  
14 increases or decreases the level of generation, that  
15 there is a direct relationship as opposed to an indirect  
16 relationship. Kind of distinguish what he was --

17           MR. BERG: Okay. I believe what Florida Power  
18 and Light was saying is that as the system load goes up,  
19 your fuel costs go up, and conversely as your system  
20 load goes down your fuel costs go down.

21           COMMISSIONER JOHNSON: And intuitively that  
22 makes sense.

23           MR. BERG: Intuitively that makes sense. And  
24 I believe their allocation methodology attempts to  
25 assign fuel cost to the cost causer, but it doesn't

1 consider the capital cost. And what we're saying is  
2 that the fuel costs are a function, at least in part, of  
3 the capital costs, so you can't consider the allocation  
4 methodology of fuel in isolation of the capital cost.

5 COMMISSIONER JOHNSON: I understand.

6 MR. BERG: That's our position.

7 COMMISSIONER JOHNSON: Okay.

8 COMMISSIONER DEASON: Any further questions?

9 Do I have a motion for Issue 10A?

10 COMMISSIONER JOHNSON: I'm going to move  
11 Staff's recommendation. Staff, is that you --

12 COMMISSIONER DEASON: Staff's  
13 recommendation --

14 COMMISSIONER JOHNSON: -- the new allocation  
15 is not appropriate; the new methodology is not  
16 appropriate. So that would be to deny the new  
17 allocation methodology.

18 COMMISSIONER DEASON: Yes. That's your  
19 motion?

20 COMMISSIONER JOHNSON: Yeah.

21 COMMISSIONER DEASON: That's the motion. Is  
22 there a second?

23 COMMISSIONER KIESLING: I'll second it. For  
24 purposes of some discussion, I guess, between the three  
25 of us, I'm having a little bit of trouble, I guess,

1 reconciling what FPL says its new methodology will do  
2 and what Staff says the new methodology will do. And  
3 since this is my first fuel adjustment hearing, I'm  
4 hoping to hear some words of wisdom on how this works,  
5 and about what kind of precedent we have for the  
6 methodology that we follow of tying the fuel costs and  
7 the capital costs in a methodology where they are both  
8 considered, I guess.

9           COMMISSIONER DEASON: Let me share some  
10 thoughts.

11           COMMISSIONER KIESLING: Thank you.

12           COMMISSIONER DEASON: And we can have some  
13 dialogue here.

14           I agree with the Staff's position because I  
15 think that there is a relationship between capital costs  
16 and the cost of fuel that's being consumed at any given  
17 time.

18           Now, taken in isolation, Florida Power and  
19 Light's argument has merit, but that's considering it in  
20 isolation. They want to take, basically, a hourly look  
21 at the consumption of fuel and assign it accordingly,  
22 but we don't do that with capital costs of the plants.  
23 We do it on a peak basis because that's the primary  
24 driving force for the construction of new plants is the  
25 peak load at any given time.

1           If we were going to be totally consistent --  
2 and I'm not proposing we do this because it's going to  
3 be highly complicated, but it seems to me that if you  
4 were going to be totally consistent, you'd have to look  
5 at capital costs on a hourly basis, and for all of those  
6 hours when you're not at a peak, and you've got large  
7 industrial customers who are running those plants 24  
8 hours a day and are taking advantage of the low fuel  
9 costs that are being generated by the nuclear units and  
10 the baseload coal units, then you would have to assign  
11 them higher capital costs during all of those off-peak  
12 times and I don't think any industrial customers want  
13 that done.

14           I think that there is a mismatch that would  
15 result from FPL's proposal. Now, I'm just not sure that  
16 we want to start down that path. And that's why I would  
17 support Staff's recommendation to simply keep the status  
18 quo.

19           COMMISSIONER KIESLING: That helped me  
20 considerably because I was trying to figure out if there  
21 was a way to do the capital costs, to keep them tied  
22 together, and I felt like I really didn't know enough to  
23 be able to vote at this time.

24           COMMISSIONER DEASON: All right. We have a  
25 motion and a second to approve Staff recommendation on

1 Issue 10A. All in favor say "aye" Aye.

2 COMMISSIONER KIESLING: Aye

3 COMMISSIONER JOHNSON: Aye.

4 COMMISSIONER DEASON: I think that is  
5 unanimous. Staff's recommendation is approved on 10A.

6 COMMISSIONER DEASON: Issue 10B.

7 MS. BASS: Commissioners, Issue 10B relates to  
8 Florida Power and Light's request to recover  
9 approximately \$2.8 million associated with equipment  
10 modifications in aid to its generating unit.

11 Essentially there are two parts to this issue:  
12 Should the Company be allowed to recover these costs  
13 through the fuel adjustment clause, and if so, over what  
14 period of time should they be recovered?

15 Staff agrees that these costs, or any costs  
16 associated with modifications or additions to generating  
17 plants, normally are evaluated during a rate case and  
18 recovered through base rates. However, in Order  
19 No. 14546 on Page 5, the Commission stated its intent to  
20 establish comprehensive guidelines for the treatment of  
21 fossil fuel-related costs, recognizing that certain  
22 unanticipated costs may have been overlooked.

23 The Commission previously has allowed  
24 utilities to recover through the fuel clause costs  
25 associated with railcars and gas pipeline laterals and

1 enhancements. The approvals were based on the  
2 demonstration that these expenditures would result in  
3 the savings to the utility's ratepayers. Based on  
4 Florida Power and Light's projections, the plant  
5 modifications are expected to result in fuel savings  
6 over \$80 million through 1999. Staff recommends that  
7 the Company's request to recover these expenditures  
8 through the fuel cost recover clause be approved.

9           As for the period of time over which the costs  
10 should be recovered, if the costs are capitalized and  
11 amortized over a period of time, the overall cost to the  
12 ratepayers will be higher due to the associated carrying  
13 costs. Staff recommends that the cost should be  
14 expensed and included in the April through September  
15 1995 fuel factor.

16           Commissioner Deason, in response to your  
17 questions and your concerns expressed regarding how the  
18 utility will ensure that those expenditures are removed  
19 from the capital assets account, if the Commission  
20 approves Staff recommendation, Staff would request that  
21 the PSC auditors look at the adjustments made by the  
22 Company in conjunction with the annual fuel audit to  
23 ensure that those adjustments have been properly made to  
24 remove the cost from depreciable plant balances.

25           COMMISSIONER DEASON: Questions,

1 Commissioners?

2           COMMISSIONER KIESLING: I move Staff, with the  
3 modification.

4           COMMISSIONER JOHNSON: I'm going to second  
5 that, I think. Are you comfortable with the methodology  
6 that they suggested to --

7           COMMISSIONER DEASON: Yes, I am. And the  
8 reason is that I, in reading the order that has been  
9 cited to so often during these hearings, is I think this  
10 is an item which fits in with that category in that it  
11 is established Commission policy. And I am even more  
12 comforted by the fact that the savings are so  
13 substantial that it would be appropriate in this  
14 situation to expense it, as Staff is suggesting, with  
15 the safeguards they've mentioned; that there will be an  
16 audit done to ensure that those costs which normally  
17 would be capitalized are taken off of the capital  
18 depreciable assets of the Company and that they are, in  
19 fact, expensed during this period. The net benefit to  
20 customers is still positive, even by expensing all of  
21 the cost during this one period, and for those reasons  
22 I'm in agreement with Staff's recommendation.

23           COMMISSIONER KIESLING: Could I ask you  
24 another question in terms of the period? In your view,  
25 is that six month -- I guess it's -- six-month period of

1 adequate length to amortize this?

2 COMMISSIONER DEASON: Yes. To answer your  
3 question directly. I think the Commission has a great  
4 deal of discretion when it comes to setting amortization  
5 periods and setting depreciation rates. At best it's --  
6 you're trying to balance benefits with cost, and lots of  
7 times you're having to look into your crystal ball.

8 I believe the fact that the savings are so  
9 substantial that even by expensing the total cost within  
10 the current period, that the savings are still positive.  
11 That that, in my opinion, is a valid reason to simply go  
12 ahead and expense those costs in the current period.

13 COMMISSIONER KIESLING: Okay. Thank you.

14 COMMISSIONER DEASON: We have a motion and a  
15 second to approve Staff recommendation on 10B. All in  
16 favor say "aye". Aye.

17 COMMISSIONER KIESLING: Aye.

18 COMMISSIONER JOHNSON: Aye.

19 COMMISSIONER DEASON: That's a unanimous vote.  
20 Staff's recommendation is approved for 10B. 10C.

21 MS. BASS: Commissioners, Issue 10C questions  
22 the reasonableness of Florida Power and Light's  
23 projection of natural gas prices during the period  
24 December 1949 through April 1995.

25 The specific area of concern lies in the fact

1 that as of today the Company is aware that the natural  
2 gas price estimates used to calculate the projected  
3 period fuel costs are indeed somewhat above actual  
4 prices. However, I believe all of the parties are aware  
5 that the projection testimony in this proceeding was due  
6 in mid-January, and the actual fuel prices for December  
7 1994 and January 1995 were not available until late  
8 January and late February respectively.

9           Therefore, unless the Utility's recovery  
10 amount is in danger of moving out of the 10% zone of  
11 reasonableness, recognizing the Commission established  
12 midcourse correction, the revised estimates are  
13 considered reasonable and are used to calculate the  
14 projected fuel factor.

15           Staff recommends that since the Company's  
16 projected amount lies within this 10% zone of  
17 reasonableness, its revised estimates of natural gas  
18 prices for the current period and the projection period  
19 are reasonable to use when calculating the Utility's  
20 projected fuel factor.

21           COMMISSIONER DEASON: Let me ask a question.  
22 Mr. Kaufmann, in his closing argument, indicated that  
23 according to his calculations there would be a  
24 55 million overestimate, and that that is approaching or  
25 exceeding a 10% threshold. What is Staff's position on

1 that?

2 MS. BASS: I have not looked specifically at  
3 his calculations, but I'm assuming that his is based on  
4 looking at gas prices in isolation of the Company's  
5 other fuels.

6 COMMISSIONER DEASON: I didn't understand it  
7 would be that way. I thought his \$55 million was  
8 approaching the 10% threshold of total fuel cost for the  
9 six-month period. And it was not just gas in isolation,  
10 that there was a 19% overestimate on just gas, and with  
11 gas approaching 50% of usage during this period, that  
12 would approach a 10% overall threshold. That's what I  
13 understood him to say. I mean, I've not done the  
14 calculations and I don't know, but if we were to just  
15 assume that those calculations are correct and we are  
16 approaching the 10% threshold, that causes me some  
17 concern. If we're going in at this stage with our best  
18 guess -- and here again, a lot of it is looking into a  
19 crystal ball and we all understand that's what we're  
20 doing here and that's why we have true-ups and midcourse  
21 corrections and all these other things, which do give us  
22 some comfort, but why would we go in if we're reasonably  
23 at a point to where we're approaching that 10%  
24 threshold?

25 MS. BASS: If we're at a point where we're

1 approaching that 10% threshold, I think it's appropriate  
2 to relook at the projections and have the Company do  
3 revised projections and provide those to us so that we  
4 can see what they expect for the remaining six months of  
5 the period, or we're looking at probably seven months of  
6 the period now, of the projected period.

7 My concern is that in the past we have had  
8 utilities come in at the last minute when they have four  
9 months of actual data available to them, as opposed to  
10 just two months actual, which is what they file in their  
11 projection filings, when their estimates have been  
12 sufficiently above what their actual costs are, or  
13 below, and there was going to be a substantial  
14 under/overrecovery, it places a tremendous burden on the  
15 Commission and Staff with these late filings that come  
16 in.

17 In the best of worlds, it would be nice to  
18 have all actual data so we could always zero out and  
19 never have a true-up. This just can't be done,  
20 especially when we have a Prehearing Order that has to  
21 be issued, we have positions we have to take, we have to  
22 let the companies know where we stand on different  
23 positions. At some point in time, we do need to cut it  
24 off and say this is our best estimate at this particular  
25 time.

1 I agree, though, as time goes on, if we do  
2 have better information which will substantially affect  
3 the cost that ratepayers will pay, then we should update  
4 the information.

5 We can ask Florida Power and Light to refile  
6 their schedules, and with the actual data that they have  
7 and perhaps provide us with actual information  
8 through -- potentially through February if it's  
9 available. That would require us coming back and having  
10 the Commission relook at it and vote on establishing a  
11 new factor for the Company.

12 COMMISSIONER DEASON: Let me make it clear, I  
13 do not want to delay these proceedings. I want to make  
14 a decision today. Obviously these factors are going to  
15 be implemented shortly, and the companies need to know  
16 what those factors are, as well as the customers need to  
17 know what those factors are. We're at a stage now where  
18 perhaps some fine-tuning needs to be done; perhaps  
19 fine-tuning does not need to be done.

20 Part of the concern that I have is that -- I  
21 do agree with you that at some point you've got to go  
22 with your best estimates, and that given our procedures  
23 here at the Commission, and all of the due process that  
24 we go through, that at some point you'd have to submit  
25 your information and go forward with it. And I'm not

1 criticizing anyone for any estimates that have been made  
2 or any efforts that have been undertaken in that regard.

3           What I am concerned with is we have a party  
4 who has intervened in this case, and that party is  
5 making an assertion that they will be harmed by an  
6 overestimation in their very competitive business. And  
7 they are also making the allegation that they are not  
8 protected by the interest rate that is calculated on  
9 overrecoveries.

10           I don't know if that's correct or incorrect,  
11 but we do make the assumption with using the commercial  
12 paper rate that that is a good surrogate for the general  
13 cost of money, and by using that interest rate, there's  
14 no incentive for the Company to overestimate or  
15 underestimate. I generally agree with that. I think  
16 that is a good policy. But, nevertheless, we have one  
17 party who is saying that is not a reasonable  
18 compensatory return, at least for them in the way they  
19 conduct business. I don't know if that's true or not  
20 but at least that is being said.

21           And if we do go in at this point and we do  
22 feel reasonably competent that the gas prices in the  
23 six-month period are going to be lower than what is  
24 projected, that we probably should take steps to correct  
25 that if we feel strong enough -- if we feel strong

1 enough we have better information now to make that  
2 fine-tuning adjustment. And that's what I guess I need  
3 some feedback from Staff on, as to whether there should  
4 be some type of a fine-tuning of that, or if the  
5 current -- I'm sorry, the estimation that was submitted  
6 by Power and Light is still reasonable to not have any  
7 type of a fine-tuning at this point.

8 MS. BROWN: Commissioner, could we have just  
9 one minute?

10 COMMISSIONER DEASON: Sure.

11 COMMISSIONER KIESLING: While you're doing  
12 that, could I add just one more question to that so you  
13 don't have to take -- I guess I want to know if Staff is  
14 in disagreement with the assertions made that more than  
15 50% of generation currently is going to be from gas and  
16 that approximately -- and that gas is overestimated at  
17 approximately 20% currently. Because if those two are  
18 true, it does seem we're awfully close to the 10%  
19 threshold.

20 COMMISSIONER DEASON: We'll take ten minutes  
21 at this time.

22 (Brief recess.)

23 - - - - -

24 COMMISSIONER DEASON: Call the hearing back to  
25 order. Ms. Brown.

1 MS. BROWN: Commissioner Deason, Staff is  
2 having trouble preparing all of the information that you  
3 wanted in your questions. They need a little more time  
4 to crunch some numbers. We would like to go ahead and  
5 do the TECO issue and then adjourn for a half hour so  
6 that Staff will have the opportunity to look at the most  
7 current figures and see if they can determine how close  
8 to the 10% zone of reasonableness Power and Light's  
9 projections are.

10 Mr. Kaufmann has another suggestion on how to  
11 deal with this I thought you might like to here.

12 COMMISSIONER DEASON: Commissioners, do you  
13 wish to hear from Mr. Kaufmann?

14 COMMISSIONER KIESLING: Sure.

15 COMMISSIONER JOHNSON: Sure.

16 COMMISSIONER DEASON: Then we'll afford Mr.  
17 Childs an opportunity to respond if he needs to.

18 Mr. Kaufmann, do you have any suggestion?

19 MR. KAUFMANN: Two points. First for  
20 clarification, the 52% number that I mentioned I have  
21 given to Staff and I have copies available for you; the  
22 page out of the FPL filing which has the total dollars  
23 estimated for the upcoming period by fuel type,  
24 including for the total and the total gas, which shows  
25 that that was 52% of total, at least to answer that

1 question -- I forget which one had that.

2           Addressing the concerns for the timing of  
3 this, we appreciate that the Commission is under a tight  
4 schedule with these kinds of cases, and we are not  
5 trying to be unreasonable and forcing you to do  
6 something hastily.

7           We came here to make a point about the effect  
8 that this has on us and to try to correct it. If we can  
9 correct it now, now that our attention has been focused  
10 on it, I would suggest one way out for the Commission  
11 would be to go ahead and put in the fuel factor under  
12 the timing that you anticipated, but ask FPL to go ahead  
13 and refile their fuel estimates immediately, including  
14 their updated -- their current data and an updated gas  
15 price estimate for the period and see if we can get that  
16 moving quickly. Of course, subject to refund, and try  
17 to -- again anticipating this would probably happen  
18 midcourse anyway, I think there is fairly good evidence  
19 that this is something that is going to have to be done,  
20 we might as well move to do it now.

21           COMMISSIONER DEASON: First of all, obviously  
22 all fuel is subject to refund.

23           MR. KAUFMANN: Obviously.

24           COMMISSIONER DEASON: And maybe Mr. Childs  
25 will want to address this, but the reason I hesitate is

1 that even though Florida Power and Light is a large  
2 utility and they do have resources, just requiring them  
3 to refile and resubmit things, that it's going to be a  
4 burden on them, and they have to devote resources and  
5 there's costs involved in having a total resubmittal of  
6 all of the information. As Mr. Childs indicated, we  
7 already require information that's probably an inch and  
8 a half thick, and that's just necessary, though, for  
9 this process to work.

10 But having to redo all of that -- we're  
11 looking at one component. It seems to me we, as  
12 reasonable people, could sit here today and, hopefully,  
13 with Staff, and when they are looking at some numbers,  
14 can do some crunching and say, "Well, the current one is  
15 reasonable enough" or "We need to reduce their estimate  
16 by 10% or whatever is reasonable," and we can just go on  
17 and have business, and then the midcourse corrections  
18 and the true-ups would just take care of themselves.

19 That's what I would like to see done,  
20 personally, is just go ahead and get this matter  
21 resolved and not have resubmittals and refilings; just  
22 takes up time and expense.

23 MR. KAUFMANN: I agree with you. Ideally it's  
24 our position that the adjustment should be made now if  
25 you're comfortable in doing that.

1 I'm trying to give an alternative if you  
2 weren't comfortable in setting a number without more  
3 information, but I think there is enough information out  
4 to do that, and I'll hand these out if you'd like.

5 COMMISSIONER DEASON: Just hold on for just a  
6 second. Mr. Childs.

7 MR. CHILDS: Very briefly. I don't want to  
8 get into reargument, but I think that the suggestion  
9 suggests that there's a decision about the feeling as to  
10 the accuracy of the gas forecast, which I don't presume  
11 would come out the same way that Mr. Kaufmann made. No,  
12 we're not interested in refiling. It's very expensive  
13 and time-consuming and we prefer not to.

14 COMMISSIONER DEASON: Let me, since we're kind  
15 of talking to the parties again here in this process,  
16 does FPL have a fear that if this Commission approves  
17 the gas forecast as submitted, that we have a high  
18 likelihood of at some point during this process having a  
19 midcourse correction? It seems to me it would be in  
20 your own interest to avoid that going in as it would be  
21 the Commission's.

22 MR. CHILDS: To answer that in part I'm going  
23 to have to comment on one of the questions that was  
24 proposed, and in commenting on it -- because that  
25 explains how I get to where I get.

1 I realize you're going to ask the Staff and  
2 the Staff is going to crunch some numbers to give you  
3 some of that information from their perspective. But  
4 setting that aside, first of all, I do not see the 10%.  
5 That the number that we heard through testimony of  
6 Florida Steel's witness was it changed to 43 million.  
7 That's based upon their assumption about how you ought  
8 to calculate fuel prices, which we pointed out we  
9 disagree with. On the other hand, it's 43 million.

10 I think they've represented that the total  
11 difference is -- that gas is 50% of the total and that  
12 if you use that amount mathematically flowing from that  
13 50%, the number that they've used, that that would  
14 approach the 10%. Well, I suggest you don't look, as I  
15 believe counsel has asked you to -- you don't look at  
16 simply the number for system fuel costs. We recover  
17 purchased power cost. The total that we're recovering  
18 in this proceeding is not the \$540 million, it's about  
19 680 or 690, if memory serves me right. That's our  
20 total. Because a substantial amount of what we buy is  
21 coal-fired power from other places; from JEA and from  
22 Georgia. So I disagree with the premise and I disagree  
23 with the math to do the calculation.

24 COMMISSIONER DEASON: Thank you.

25 COMMISSIONER KIESLING: Could I ask Mr.

1 Childs --

2           So when Mr. Kaufmann looks at the document  
3 that he has that was filed by FPL that projects the fuel  
4 mix, and that document show also 52% of the projected  
5 fuel mix is going to be gas, that does not include some  
6 other factors that would actually bring that mix down  
7 below 50%?

8           MR. CHILDS: That's right. And even --

9           COMMISSIONER KIESLING: That's what I want to  
10 understand.

11           MR. CHILDS: The document he's looked at  
12 calculates the number; it's approximately 544 million.  
13 That number is in one of the numbers on the E1 Schedule.  
14 It's Line 1. That's one of the numbers, 544 million.  
15 But when you add it all up, you end up with total fuel  
16 and net power transactions, Line 20, 690 million.

17           COMMISSIONER KIESLING: And is it your  
18 position that the 10% threshold applies to the total  
19 number and not just the fuel component on Line 1?

20           MR. CHILDS: The 10%, I believe, has always  
21 applied to the total. And I believe that it has because  
22 of the recognition that you could have, hypothetically,  
23 a cost -- you could have one component that is off by  
24 30%, 40%, but the compensating changes in other  
25 directions make that change less than 10% bottom line.

1 And/or you could have a change simply on sales so that  
2 your cost item for one component of fuel may be off, but  
3 your sales figure has -- your generation figure has  
4 changed.

5 COMMISSIONER KIESLING: Maybe I wasn't  
6 entirely clear. I just want to know as between the  
7 500-and-some-thousand number and 600-and-some-thousand.

8 MR. CHILDS: 600-and-some-thousand.

9 COMMISSIONER KIESLING: Million, million,  
10 sorry --

11 MR. CHILDS: Yes.

12 COMMISSIONER KIESLING: -- numbers, which of  
13 those numbers is the one to which the 10% threshold  
14 applies?

15 MR. CHILDS: I believe it's the total number.

16 COMMISSIONER KIESLING: 600 something.

17 MR. CHILDS: That's right.

18 COMMISSIONER KIESLING: That's all I want to  
19 understand. You keep saying the total of the fuel but  
20 you weren't saying the total of the fuel plus the  
21 purchase price.

22 MR. CHILDS: Well, I think my confusion in one  
23 comment is that the 690 is total fuel costs, it's just  
24 that part of it we are paying another utility their fuel  
25 costs associated with our purchased power. In other

1 words, we didn't generate it through our unit that we  
2 own, we bought it out of a unit that someone else owns  
3 and we pay them their cost.

4 COMMISSIONER KIESLING: Can I ask Staff  
5 another question. Since you all do this calculation,  
6 when you calculate during a midcourse correction, or any  
7 other time, the 10% threshold, do you calculate it on  
8 the total?

9 MS. BASS: We calculate it on the total fuel  
10 and net power transactions, which would include the  
11 actual fuel cost to the Company to generate, plus  
12 purchased power. It takes into consideration their  
13 sales to other utilities; all of that flows through to  
14 one number.

15 COMMISSIONER KIESLING: Then if I understand  
16 that part, then if we were to compare, from the  
17 projections, the total amount -- or the percentage of  
18 that total, which is to gas, it would no longer be over  
19 50% if you include in the purchased power.

20 MS. BASS: Exactly. It's less than 50%.

21 COMMISSIONER KIESLING: Okay. Even if they  
22 have overestimated by 20%, 20% of less than 50% is not  
23 going to be 10%. I think I understand the basic decimal  
24 system.

25 MS. BASS: I'll agree with that.

1           Another thing that I think I need to point out  
2 is that there's not a direct relationship. You can't  
3 look at just the change in one component of all of the  
4 components that add up to this total fuel and net power  
5 transaction. Because you have a significant change in  
6 one fuel type, there may also be significant fuel  
7 changes in other fuel types which would offset it, or  
8 even in purchased power there can be significant changes  
9 in what the utility projects to purchase and actually  
10 purchases. So that's why we look at total fuel and net  
11 power transactions when determining the 10% midcourse  
12 correction threshold.

13           COMMISSIONER DEASON: It's safe to say that it  
14 is a dynamic process. There are many different factors  
15 and those factors are interdependent upon each other and  
16 how they and the Company reacts from the various  
17 economic factors that go in, and that's why estimates  
18 are always different from actuals.

19           MS. BASS: Exactly. It's not necessarily only  
20 tied to just the fuel cost and the purchased power  
21 transactions. It's also tied to whether or not the  
22 utility has right-on-the-nose projected what their sales  
23 are going to be, because that has an impact on the  
24 dollars that are collected.

25           COMMISSIONER DEASON: That was the reason, I

1 just wanted Staff just to kind of take a commonsense  
2 approach and take a look at this and see what is the  
3 likelihood that we're going to be faced with a midcourse  
4 correction. If we know going in the likelihood is high,  
5 why don't we fine-tune a few things to where we think  
6 we're going to avoid a midcourse correction. If we  
7 think the current numbers are such that the likelihood  
8 is small we're going to have a midcourse correction, it  
9 seems to me that maybe it's reasonable enough realizing  
10 that things are going to go up and down during the six  
11 months, and sales are going to be different than are  
12 projected. The availability of units may be different.  
13 The price of electricity through purchased power may  
14 change and that may change the mix, but if we think that  
15 going in all of those things are going to  
16 counterbalance, that we're going to avoid a midcourse  
17 correction, perhaps then it's reasonable and we can go  
18 forward.

19 My concern is that it seemed to me is that  
20 there was -- at least it was one party's position that  
21 we were right on the verge of a midcourse correction  
22 before we even started the period, and that's what I  
23 wanted to try to avoid. And I wanted Staff to try to  
24 take a look at that and see what they felt. And they  
25 would consider these things. I'm sure they would

1 consider the purchased power mix in the things, into the  
2 various calculations to see if whether a midcourse  
3 correction would be likely or unlikely.

4 MS. BASS: We would be more than happy to do  
5 that given a little additional time to look at it.

6 I would like to say I do have some concerns in  
7 fine-tuning the Company's projections. There are so  
8 many variables included in that and I'm not sure how  
9 much we should correct. You know, what are we going to  
10 establish now, percentage, that if they are close to 10  
11 we bring them to 5. You know, I have some real concerns  
12 in getting into those areas of projections, and when do  
13 we determine that a particular utility's projections are  
14 way out of line and that we take it upon ourselves to  
15 bring them back? I don't want to put us in a position  
16 of bringing them to a point where we may reverse a  
17 process and put them into a midcourse correction the  
18 other way. It's so arbitrary. I have some real  
19 concerns with doing that. But we'd be more than happy  
20 to look the these and give you our opinion on how close  
21 we are to that.

22 COMMISSIONER DEASON: I agree, we don't want  
23 to err on the other side and have a midcourse correction  
24 for the wrong reason. We don't want to cause a  
25 midcourse correction. That would be the furthest thing

1 I would desire to do. I want to try to avoid a  
2 midcourse correction on the front end.

3 COMMISSIONER KIESLING: Let me just say this:  
4 Having heard the explanation that I finally got of what  
5 the total is that you make that calculation on, I am now  
6 satisfied that the calculations that were made by  
7 Florida Steel were not made taking into consideration  
8 the purchased power, the fuel cost on that, and that,  
9 therefore, their total hypothesis now is -- I don't find  
10 to be valid, because it's not -- gas is not based on the  
11 projections; going to be anywhere close to 50%, so even  
12 a 20% overestimate isn't going to come close to the 10%.

13 I'm not trying to stop you all from going and  
14 doing the calculations, but it seems to me that the  
15 hypothesis that was offered by Florida Steel on how they  
16 get to the point of thinking we're close to 10% is no  
17 longer valid in my mind.

18 MR. KAUFMANN: Commissioner, if I can address  
19 that.

20 COMMISSIONER KIESLING: No, I'm not asking you  
21 to address anything.

22 (Simultaneous conversation)

23 COMMISSIONER KIESLING: Mr. Kaufmann, I'm not  
24 asking you to address anything.

25 MR. KAUFMANN: I understand.

1           COMMISSIONER KIESLING: I'm not asking you to  
2 address anything. Thank you.

3           So all I'm saying at this point is that with  
4 the final answers that I finally got on what you use to  
5 calculate that, I'm satisfied with the reasonableness of  
6 the projections, and for myself, I don't need anything  
7 else. I'm not trying to say we aren't going to do that  
8 but I just wanted to -- since I was the one who asked  
9 those initial questions about is it over 50%, is it over  
10 20%, you know, I'm now satisfied for the questions that  
11 I asked.

12           COMMISSIONER DEASON: Commissioner Johnson, do  
13 you have any questions or directions to Staff?

14           COMMISSIONER JOHNSON: No.

15           COMMISSIONER DEASON: I'd like for Staff to do  
16 a quick and dirty calculation, if that's all it is, to  
17 try to assure yourselves at least that we're not right  
18 on the verge of a midcourse correction before we even  
19 enter the six-month period, and just get some feedback  
20 from you all from that and then I'd be in a better  
21 position to know.

22           And I do understand that it's difficult, this  
23 is a very dynamic process and it's difficult to pick one  
24 factor in isolation and change it because it probably  
25 will have a ripple effect on other things. And by

1 trying to fine-tune you maybe throwing the whole thing  
2 out of whack, and I certainly want to avoid that. I  
3 think if you all can take a look at it and give us some  
4 feedback from your viewpoint, then we would be better  
5 prepared to make a decision. And I understand  
6 Commissioner Kiesling's position that she's satisfied,  
7 and I certainly respect that and it's for very valid  
8 reasons that she reaches that conclusion. I personally  
9 would just like a little more feedback from Staff.

10 MS. BASS: We'll be happy to make those  
11 calculations.

12 MS. BROWN: Commissioner, why don't we proceed  
13 with TECO's remaining issue and if we could adjourn for  
14 a half hour and reconvene.

15 COMMISSIONER DEASON: We can proceed now to  
16 Issue 23A.

17 MR. BERG: Issue 23A read, "Should the 'Option  
18 Payment' that Tampa Electric received from Polk in 1993  
19 be treated as a credit in the capacity cost recovery  
20 clause?"

21 Staff recommends that the Commission require  
22 Tampa Electric to credit the \$1.1 million option payment  
23 back to the retail ratepayer through this clause.

24 We believe that requiring Tampa Electric to  
25 credit this money back to the ratepayer would result in

1 a proper matching of the risk and benefits associated  
2 with this transaction.

3           The risk of this transaction that I'm  
4 referring to is the risk that the ratepayer bears on a  
5 dollar-for-dollar basis to reimburse Tampa Electric for  
6 all of the energy and capacity payments they will make  
7 to Orange Cogen over the contract life. Because the  
8 ratepayers have assumed this risk, I believe they should  
9 receive all of the benefits that also result from this  
10 transaction; not just part of the benefits as Tampa  
11 Electric is proposing, but all of them; that would  
12 include the fuel savings that are already there, and  
13 this option payment.

14           One final point I would like to make is this  
15 principle of matching risk and benefits is the same  
16 principle that Staff and parties filed in Issue 23B  
17 which was stipulated by all of the parties.

18           In that issue we recognize that the  
19 shareholders were effectively required to bear all the  
20 risk associated with this wholesale -- this separated  
21 wholesale class of customers, and in return we  
22 recommended to the Commission that the shareholders be  
23 allowed to receive any of the benefits that would later  
24 arise from this transaction as well.

25           So I guess our simple straightforward position

1 is that we believe the ratepayer bears all of the risk  
2 associated with this transaction and should, therefore,  
3 receive all of the benefits.

4 That concludes Staff's recommendation.

5 COMMISSIONER DEASON: Questions,  
6 Commissioners?

7 Let me ask a question. I agree with you that  
8 there are risks that are being taken on by the customers  
9 when we're dealing with these type of contracts. In  
10 fact, that's the only way these contracts can come about  
11 is because they are submitted to the Commission and we  
12 look at them and we include them for recovery purposes,  
13 and that's part of the process. And the customers  
14 basically are at risk for providing the revenue stream  
15 to support the benefits derived from those contracts,  
16 which is the capacity and energy that is provided.

17 But there was a modification, and we looked at  
18 that and we found it to be in the public interest and  
19 there were some benefits that were derived for the  
20 customers. I guess my question is if we strictly follow  
21 Staff's recommendation, where's the incentive for TECO  
22 to look at these type contract modifications, try to  
23 look at alternatives, try to negotiate with the  
24 cogenerator or whomever to try to come out with the best  
25 deal for the customer if 100% of every benefit is going

1 to flow through the clause to the customer. Where would  
2 we be if TECO had not gone to the effort of negotiating  
3 this arrangement and had just constructed the temporary  
4 interconnection and had just had the CIAC booked, there  
5 would have been no net benefit that we're now looking at  
6 to the customer. And what I want to avoid is a policy  
7 which would negate all potential benefit to a company  
8 such as TECO to look at all of the alternatives and to  
9 earnestly negotiate and try to strike the very best  
10 bargain for everyone involved. That's my concern.

11 MR. BERG: I understand your concern.

12 I guess my first response would be simply the  
13 regulatory compact, and that is that the utility is  
14 allowed to recover reasonable and prudent costs and in  
15 return, they are granted the opportunity to earn a fair,  
16 just and reasonable return on their investment.

17 I guess that would be my response. And  
18 something else -- and I'm not intimately familiar with  
19 the contract modifications and all of that, but it is my  
20 understanding that the benefits that were spoken of,  
21 i.e., the fuel savings, would have been there regardless  
22 of whether or not the option payment was chosen or the  
23 temporary interconnection option was chosen.

24 So I think the benefits would have been there  
25 regardless of the choice that Orange Cogen made. And

1 that's my response.

2 COMMISSIONER KIESLING: Let me ask another  
3 question. I mean I'm looking back over my notes, and  
4 thinking back over the testimony, and my recollection is  
5 that TECO's witness was fairly firm in his conviction  
6 that all of the risks were not on the ratepayers. And I  
7 guess I would like you to kind of summarise, if you can  
8 in a very quick way, what testimony there is in the  
9 record that establishes your perspective that all of the  
10 risk is on the ratepayer. And that may be one for the  
11 lawyer, and I'm not trying to pick who does it, but you  
12 were asking the questions so I figure you must know the  
13 answers.

14 MS. BROWN: Commissioner, I think part of the  
15 problem with the testimony stems from Mr. Mestas'  
16 perspective on the option payment versus the standard  
17 offer contract and our perspective on that.

18 I think he did testify that the ratepayers are  
19 fully responsible dollar for dollar for the costs of the  
20 standard offer contract. That's the risk that Staff is  
21 talking about. There is a risk in fluctuation in energy  
22 costs that come out of that contract and are very simple  
23 but not simplistic, but the simple principle is that if  
24 the ratepayers bear those risks, then they are entitled  
25 to the benefits that stem from that standard offer

1 contract.

2           Now, this is unique. This option payment is  
3 unusual and it's not the same as capacity payments or  
4 purchases, but it still arises from Staff's perspective  
5 out of that standard offer contract for which the  
6 ratepayers are responsible.

7           And I think that's why we were sort of talking  
8 at cross purposes in the testimony because Mr. Mestas'  
9 perspective was this was something entirely separate  
10 from anything that had to do with capacity costs  
11 associated with the contract, and our perspective is  
12 that it is not.

13           COMMISSIONER KIESLING: I guess my concern is  
14 that certainly as I understand, you know, what I'm  
15 supposed to be doing here is that Staff may have its  
16 perspective, but Staff didn't put on a witness, and,  
17 therefore, the only witness whose testimony I can look  
18 to for factual support for Staff's position is Mr.  
19 Mestas. And in your cross of him, I agree, you were  
20 going at cross purposes. But I don't recall that  
21 through your cross you were able to get testimony that  
22 supports your perspective in that I do recall you  
23 started leading him down the proverbial "primrose path",  
24 dollar for dollar, "Do you agree with this? Do you  
25 agree with that?" but there came a point where he said,

1 "No, I don't agree." And there's nothing to counter  
2 that. Or if there is, please tell me what it is.

3 MS. BROWN: I don't know that I can remember  
4 exactly the testimony and I don't have the transcript  
5 before me. I think I would simply repeat it's not my  
6 understanding that the cross purposes we were at was on  
7 a factual basis; it was a philosophical policy  
8 disagreement.

9 COMMISSIONER KIESLING: Okay.

10 COMMISSIONER JOHNSON: Explain to me what you  
11 thought the philosophical policy disagreement was.

12 It was quite clear from his testimony and from  
13 the closing arguments that TECO was stating the changes  
14 were basically risk-free and it wasn't something that  
15 impacted the ratepayer on a dollar-for-dollar basis.  
16 And what Staff is saying, no, there is a risk associated  
17 with it, and, therefore --

18 MS. BROWN: The risk does not arise from the  
19 option payment transaction from our perspective. The  
20 risk arises from the fundamental underlying standard  
21 offer contract from which all of these other  
22 transactions sort of -- it was the basis. There would  
23 not have been an option payment if there weren't a  
24 standard offer contract to transfer from one cogen  
25 facility to the other. The risks that the ratepayers

1 bear under that standard offer contract is what we're  
2 talking about.

3 COMMISSIONER JOHNSON: So you would almost  
4 agree with him with respect to the option, what's that  
5 called, option payment or whatever, that there aren't  
6 direct risks associated with that, but you tie the  
7 option back to the original instrument in saying that  
8 with respect to that.

9 MS. BROWN: There would be no option --

10 COMMISSIONER JOHNSON: And that's where you  
11 totally disagree.

12 MS. BROWN: And that's a philosophical  
13 difference, I think, not a factual difference. From our  
14 perspective, there would be no option payment if it  
15 weren't for that original contract that the ratepayers  
16 were responsible totally for.

17 COMMISSIONER JOHNSON: So the opportunity to  
18 have that option payment arose because of --

19 MS. BROWN: That's right. And for that reason  
20 the ratepayers ought to be the ones to get the benefits  
21 from whatever transactions arise out of this standard  
22 offer contract.

23 COMMISSIONER JOHNSON: One of the things I  
24 know TECO also suggested is that by a ruling consistent  
25 with what Staff has articulated, is that you'll end up

1 penalizing companies for making those more economical  
2 decisions. On its face that does appear to be --

3 MS. BROWN: I disagree with that  
4 characterization of what you would be doing if you  
5 allowed this benefit to flow to the ratepayers. I see  
6 no penalty associated with this to TECO.

7 COMMISSIONER JOHNSON: It's a disincentive  
8 maybe from entering into the --

9 MS. BROWN: TECO would be held harmless  
10 otherwise, and the economic decision was made by the  
11 cogenerator, not by TECO. The cogenerator decided to  
12 pay \$1 million option payment as opposed to \$2 million  
13 in interconnection fees. So I don't see -- I don't  
14 think you can characterize this as a penalty to TECO.  
15 It doesn't seem to fit. It's a benefit that they have  
16 taken but there's no taking it, putting it to their  
17 ratepayers. They are saying it's going to benefit their  
18 ratepayers anyway. Putting it through the clause dollar  
19 for dollar doesn't penalize them I don't think.

20 COMMISSIONER KIESLING: I have one more  
21 question and I think it's probably for Mr. Pruitt.

22 Is it within our discretion to divide this  
23 option payment in any way and have some go into one  
24 account and some go to the benefit of the ratepayers?  
25 Or are we bound on this statute to do only one or the

1 other?

2 MR. PRUITT: I think you are bound by the  
3 statute to do one or the other. And I think you are  
4 bound by the rule that it takes compete substantial  
5 evidence to overcome testimony.

6 MS. BROWN: May I just add something to that?  
7 I'm not sure what statute we're talking about. There is  
8 no statute with respect to the fuel clause.

9 COMMISSIONER KIESLING: That's true.

10 MS. BROWN: It was established by order.

11 COMMISSIONER DEASON: Let me say that this  
12 Commission has a history of sharing benefits.

13 MS. BROWN: Yes.

14 COMMISSIONER DEASON: To offer incentives to  
15 companies to take certain actions, that they would share  
16 in the benefits themselves for taking initiatives. We  
17 have, you know, what is it, economy transactions, where  
18 there's a split-the-savings approach. So I mean it's  
19 something the Commission has done. It's not a situation  
20 where there's no precedent for doing something along  
21 those lines.

22 COMMISSIONER KIESLING: It's your view if we  
23 wanted to, we do have the discretion to come to some  
24 split in this situation?

25 COMMISSIONER DEASON: I would think we would

1 have that discretion. We've exercised that discretion  
2 in the past. Obviously, whatever we do is going to have  
3 to be consistent with the statute, but as far as I know  
4 the statutes give us enough discretion to allow that  
5 type of sharing the benefits.

6 MS. BROWN: I'm uncertain to make a  
7 recommendation to you on it until I talk to Staff people  
8 who know a little more about how that is done. But my  
9 initial reaction is that you do have the discretion to  
10 split the baby if you want to.

11 COMMISSIONER DEASON: Let me reiterate that  
12 what brought on my initial questions was not the fact  
13 that the ratepayer -- I think the ratepayers are  
14 entitled to some of these benefits. It's a question of  
15 all or how much. And my concern is that I want  
16 companies such as TECO to have an incentive to engage in  
17 the type practice which TECO has engaged in in the very  
18 situation. Because if they had not taken the initiative  
19 and ended up with this result, we wouldn't even have the  
20 issue here. We wouldn't even be debating what benefits  
21 to share with whom. There would be the construction of  
22 a temporary interconnect at some \$2 million, and there  
23 would be \$2 million of CIAC booked, and be a net wash to  
24 the company and the customers. There would be no  
25 benefit for anyone. That's what my concern is.

1 I agree with Staff that -- I think we all can  
2 agree that there's two basic mechanisms for the  
3 recognition of cost and risk and how those costs and  
4 risks are going to be reimbursed or taken care of. We  
5 have base rate proceedings and we have fuel adjustment  
6 proceedings.

7 I think that this contract that has been  
8 modified falls squarely in the situation of fuel  
9 adjustment type proceedings. All of the risk associated  
10 with that contract -- there's no base rate risk  
11 associated -- it's not in the rate base of the Company.  
12 It's all within the clause. And the customers have the  
13 risk of reimbursing dollar for dollar for the cost  
14 associated with that contract. And it is a standard  
15 offer contract. It is a creation of this Commission. I  
16 don't know of the Commission ever disallowing any cost  
17 from a standard offer contract. I'm not saying it could  
18 never happen but I'm not aware of it ever happening.

19 So I think that it falls squarely within the  
20 fuel adjustment proceedings. That's where the risks are  
21 and the risks are on the ratepayers.

22 The example which Mr. Beasley gave of the  
23 transformer, whatever, and that being "other electric  
24 revenue," I agree that would be the treatment for that  
25 and that would be the proper treatment for that. But

1 that would be cost associated with base rate  
2 proceedings. That would be some O&M expenses for the  
3 employees who would do -- install the transformer. I  
4 guess the transformer maybe would come out of materials  
5 and supplies, which is a rate base component, and all of  
6 that is part of the rate base. And when they got that  
7 revenue, it rightfully would be booked as "other  
8 electric revenue" and it would go into that pot of  
9 dollars.

10 This is a different situation we have here.  
11 The only reason that this option payment came about is  
12 because of the existence of this standard offer  
13 contract, which is the creation of this Commission, the  
14 concept, and the fact that those costs are going to be  
15 included dollar for dollar in fuel adjustment recovery  
16 clauses.

17 So my concern is where is the incentive for a  
18 company to do as TECO did in this case and come up with  
19 a novel solution to a problem that creates positive  
20 benefits. And that's where my concern is.

21 MS. BROWN: Let me try to address that just  
22 for a minute. First of all, the incentive is that in  
23 any way that the companies can lower the costs of these  
24 rather expensive standard offer cogeneration contracts,  
25 they are going to lower rates to their ratepayers, put

1 themselves in a better rate position by doing it.  
2 That's the fundamental incentive they have is to lower  
3 their customers' rates. If they can use a creative  
4 means to come up with a benefit that is going to lower  
5 those rates, then that's the real incentive they have.

6           The trouble I have with this particular  
7 arrangement is that the benefits that Mr. Mestas  
8 testified to are all projected fuel savings. They are  
9 somewhere out there in the blue. The dollars, the real  
10 dollars, are in the "other electric revenues" account.  
11 Dollar for dollar goes out from the ratepayers, but it  
12 doesn't look like the dollars for dollars are coming  
13 back in.

14           COMMISSIONER DEASON: Does Staff agree that  
15 there's a 4.5 million savings in fuel?

16           MS. BROWN: The Commission has already  
17 determined there will be a between \$1.5 and \$4.5 million  
18 fuel savings benefit to increase the capacity factor, or  
19 I think it's Orange Cogen operates under --

20           COMMISSIONER DEASON: Is that over the life of  
21 that contract or is that for a finite period?

22           MS. BROWN: No. I think it's over the life of  
23 the contract.

24           COMMISSIONER DEASON: And that is --

25           MS. BROWN: 20 years.

1           COMMISSIONER DEASON: That could change but  
2 right now it appears that's the situation.

3           MS. BROWN: It could. So we're talking 4.5  
4 over 20 years as opposed to \$1 million credit now.

5           COMMISSIONER DEASON: But the 4.5 million  
6 savings is not contingent upon the 1.1 million. They  
7 are two different concepts.

8           The option payment was made and is not  
9 contingent on there being some type of a fuel savings or  
10 anything of that nature. That was basically a  
11 concession paid to TECO to avoid the necessity of having  
12 an expensive interconnection built to abide by the  
13 strict terms of the original contract.

14          MS. BROWN: Yes. That's the evidence that is  
15 on the record.

16          There was the additional benefit to Orange  
17 Cogen to transfer -- to Polk Power Partners to transfer  
18 of the standard offer contract, and this came up in  
19 the -- when you approved the modifications to the  
20 contract, to transfer the standard offer contract to be  
21 served from Orange Cogen, freed up the capacity on the  
22 Mulberry plant to sell additional capacity to Florida  
23 Power Corporation. That was another motivation for  
24 switching the TECO standard offer consider from the  
25 cogenerators' perspective.

1           COMMISSIONER JOHNSON: Let me get a  
2 clarification. I know legal -- with respect to the  
3 incentive issue and whether or not we should be  
4 concerned about that, your position is that they have  
5 their own incentive with respect to just lowering those  
6 rates.

7           MS. BROWN: Fundamentally I think they do.

8           COMMISSIONER JOHNSON: I'm not sure this is  
9 appropriate, Mr. Chair, but Public Counsel had mentioned  
10 almost the same issue and I wanted to hear a little bit  
11 more about them, when he talked about, in his closing,  
12 this particular decision. He stated that it was in  
13 their own business interest -- and I have down here and  
14 I don't know if you said this or I was thinking about  
15 this -- the approaching competitive market will act as  
16 the incentive to induce them to do these kind of things  
17 again and again and again. And I wanted to hear a  
18 little bit more about Public Counsel's position on that  
19 whole issue, if that's okay.

20           COMMISSIONER DEASON: I don't have a problem  
21 with that. Obviously, we'd have to give Mr. Beasley an  
22 opportunity to give his viewpoint on it as well, I would  
23 think, to be fair, but I don't have any an objection if  
24 you want to ask a question of Public Counsel.

25           MR. HOWE: Thank you, Commissioners.

1 I guess I'd have to tie it in with something I  
2 said yesterday. I think we're seeing a change, a  
3 significant change in the electric utility industry.

4 Whereas before, if a utility could justify  
5 costs, the motivation was to come in and get the rates  
6 to cover the cost. Now we're in a time frame where  
7 we're seeing utilities cutting back on their work  
8 forces, introducing economies, doing everything they can  
9 to pare expenses and streamline their operations.

10 Now, clearly anything they do to reduce  
11 expenses, to reduce fuel costs, to make more prudent  
12 investments will work out to the ratepayers' benefit  
13 under a traditional cost recovery regulatory scheme  
14 because the sum total of the costs you're going to add  
15 up for them to recover is going to be lower. And if  
16 their investment is lower, obviously the return  
17 component will be lower also.

18 But yet I think what you are seeing now is the  
19 fact we're moving away from the regulatory scheme and  
20 the motivation now is for them to position themselves  
21 for what they see as future competition, so they have an  
22 internal business reason for getting their expenses  
23 lower, to make their investments very prudent, to  
24 streamline their operations so they don't find  
25 themselves, for example, with the high cost units or

1 high cost fuel when a municipality goes into the market,  
2 for example, "We're looking for a utility that can  
3 provide us with service over the next 30 years. Who has  
4 the cheapest power available, the most efficient?" So  
5 you're seeing a change in motivation. I think when a  
6 utility makes a decision to engage in these things, you  
7 get an after-the-fact appraisal. They say, "Okay, we  
8 looked at this, now for this short time period, though,  
9 could we get a few dollars by saying it saved the  
10 customers money." That's where you see it being brought  
11 into the cost recovery mechanism simply because the rate  
12 base mechanism, it isn't taken away but it's not  
13 perceived as being as available as it used to be because  
14 it doesn't fit the Company's own internal motivations.

15 Thank you.

16 COMMISSIONER DEASON: Mr. Beasley.

17 MR. BEASLEY: Commissioners, I would just say  
18 that this negotiation was conducted in the framework of  
19 the existing regulatory model, not something that may  
20 occur out in the future as Mr. Howe suggests. And in  
21 that model a utility is encouraged to go after a dollar  
22 of revenue and to go after a dollar of cost savings, and  
23 if they can better themselves by doing that within their  
24 allowed range of their rate of return, the Commission  
25 has indicated they should.

1           That's what the Company did in this instance,  
2 and that's why we feel that the Company should be  
3 allowed to retain the \$1.1 million option payment.

4           COMMISSIONER DEASON: Any questions? Does  
5 Staff have any concluding comments before we entertain a  
6 motion?

7           MR. BERG: I'd like to point out something  
8 Mr. Beasley said. He said Tampa Electric is operating  
9 under the old regulatory model where a utility is going  
10 out and doing everything they can to increase revenues  
11 and reduce cost. But the distinction we're making is  
12 that they're doing it at the expense of the ratepayers  
13 in this particular case. And it's the difference  
14 between the base rate cost and the dollar-for-dollar  
15 adjustment clause cost, and I just wanted to make that  
16 distinction.

17           COMMISSIONER DEASON: Do I have a motion?  
18 We're going to have to come back, I think, in about a  
19 half hour. If you wish to address it then or if you  
20 want to address it now, I'm flexible.

21           COMMISSIONER KIESLING: I don't know if a half  
22 hour is going to make any difference for me.

23           I'm still unclear on whether we can split it  
24 in some way, and I guess if I feel comfortable that we  
25 can do that, then I feel comfortable that we can allow

1 them to retain some portion so that we do have this --  
2 I'll call it an incentive even though I'm not talking a  
3 technical incentive -- to look for these kind of deals.

4 And I guess I'm troubled by the fact that our  
5 counsel says we don't have the discretion to do that,  
6 and the legal Staff says we do, and I'm just not sure  
7 what we have.

8 MS. BROWN: I'm sorry for this --  
9 Commissioner, if we are going to take a half an hour,  
10 while the Staff is crunching numbers for FPL's gas  
11 forecast, perhaps I can get with Mr. Pruitt and we can  
12 discuss this and I can also talk to technical Staff, so  
13 that I'm not really comfortable with telling you you can  
14 or can't right now either. I would like to research it  
15 a little bit. Would that be all right?

16 COMMISSIONER DEASON: I have no problem with  
17 that. We'll -- is a half hour sufficient time for us?

18 MS. BROWN: We'll certainly try.

19 COMMISSIONER DEASON: It's about ten minutes  
20 to 12 now. We'll stand in recess until 12:20.

21 MS. BROWN: Okay.

22 (Brief recess.)

23 - - - - -

24 COMMISSIONER DEASON: Call the hearing back to  
25 order.

1 MS. BROWN: Commissioner, in the break, Tampa  
2 Electric pointed out to me that I had misspoken and I  
3 want to correct that on the record. The \$4.5 million  
4 benefit that we have been talking about is a net present  
5 value benefit.

6 That's what happens when you put me together  
7 with numbers. I apologize.

8 COMMISSIONER DEASON: And that's the net  
9 present value benefit over the life of the contract  
10 modification?

11 MS. BROWN: Yes, that's correct.

12 COMMISSIONER DEASON: Okay. Would it be best  
13 to proceed to 23A or to go to 10C?

14 MS. BROWN: 23A. We're still waiting on some  
15 schedules for 10C.

16 COMMISSIONER DEASON: I believe there was a  
17 question on 23A concerning the Commission's ability or  
18 discretion to share benefits.

19 MS. BROWN: Mr. Pruitt and I discussed that in  
20 the interim and he has a recommendation for you.

21 COMMISSIONER DEASON: Mr. Pruitt?

22 MR. PRUITT: Mr. Chairman, counsel for the  
23 Staff has assured me that there is sufficient, competent  
24 evidence in the record to support a Commission order, a  
25 decision, to require an immediate return of these funds

1 to the ratepayers; and also that the record would  
2 support a Commission decision to allow TECO to retain  
3 them; and that there is of record other Commission  
4 orders allowing a, quote, "sharing" between the utility  
5 and the ratepayers.

6           And this being true, I have no problem in  
7 advising you that you have the necessarily implied  
8 authority to order a sharing of these funds between the  
9 utility and the ratepayer, based somewhat on a case I  
10 have cited a lot of times before you, and that is where  
11 the Supreme Court of Florida says, "The Commissioners  
12 can use their own knowledge and expertise to bolster  
13 competent, substantial evidence in order to arrive at a  
14 legally sufficient conclusion." That's the Gulf Power  
15 v. Beavis (1975), 322 So.2d 30.

16           I also get a little comfort out of an Alabama  
17 case that I have been carrying around here a long time,  
18 which the Supreme Court of Alabama, in Alabama Gas Corp  
19 v. Alabama Public Service Commission, 425 So.2d 430, in  
20 1982 said, "The Commission is not rigidly bound to the  
21 particular recommendation of any particular witness.  
22 The Commission's function is to sit as an expert  
23 administrative body, analyzing the evidence and  
24 exercising its own expert judgment thereon. This is  
25 true, even though only one witness testifies as to a

1 particular set of facts."

2           So based on all that, I would think that the  
3 Commission would have the lawful authority to order a  
4 sharing between the utility and the ratepayers.

5           COMMISSIONER DEASON: Further questions,  
6 Commissioners?

7           COMMISSIONER KIESLING: I'm willing to make a  
8 motion for discussion purposes. And I would move that  
9 the option payment be split 50/50 with half going into  
10 the other electric revenue category where it already is  
11 and the other half going to the benefit of the  
12 ratepayers.

13           COMMISSIONER DEASON: Okay. We have a motion,  
14 is there any discussion or second?

15           COMMISSIONER JOHNSON: I think we have already  
16 engaged in a lot of discussion with respect to the  
17 issue. And this was a rather difficult one for me,  
18 given the policy arguments on both sides with respect to  
19 whether or not the company needed this kind of an  
20 incentive but recognizing that they did make a very  
21 economical decision that did and in fact will probably  
22 benefit the ratepayers. And that is the kind of thing  
23 we want to see more of.

24           I do believe that we are approaching a  
25 different kind of a regulatory environment, but that the

1 comments of TECO with respect to where we are now and  
2 how they handle their affairs were somewhat persuasive.  
3 So with that, I think the best thing to do here is  
4 probably to split it.

5           And for those reasons, I'll go ahead and  
6 second that motion.

7           COMMISSIONER DEASON: We have a motion and a  
8 second.

9           I'm, just so everyone is clear, I'm going to  
10 support the motion. I think it is a fair resolution. I  
11 think there is ample evidence in the record to justify  
12 this type of a decision.

13           I would think that the Commission would not be  
14 bound to a 50/50 split, there are other options. I know  
15 that in the split the savings, I believe it is an 80/20  
16 split. I think the Commissions in the past have used  
17 different techniques to split, but in this case I'm not  
18 opposed to a 50/50 split. I think where we have 80/20  
19 splits that's in a situation where you think they are  
20 going to be recurring opportunities on a fairly regular  
21 basis for there to be saving and that, give that type of  
22 scenario, we award the majority of the savings to the  
23 customers.

24           Here, I think this is a rather unique  
25 situation. While there may be some occasions in the

1 future to renegotiate some standard offer contracts or  
2 similar things, I don't think it's of quite the  
3 recurring nature as we view economy sales and things of  
4 that nature; so I think this was a rather unique  
5 situation in that there was a great deal of initiative  
6 demonstrated and I believe a 50/50 split would certainly  
7 be fair.

8 We do have a motion and a second. All in  
9 favor say aye.

10 (All Commissioners vote aye.)

11 COMMISSIONER DEASON: I think the motion  
12 carries unanimously. That disposes of Issue 23A. Yes?

13 MR. BEASLEY: Mr. Chairman, I have one  
14 question of the portion to be flowed through to the  
15 customers. We wanted to propose and see if it would be  
16 acceptable to show that as a credit in the forthcoming  
17 true-up as opposed to recalculating the factor, so we  
18 could leave here with a factor that would be in the  
19 true-up with interest.

20 COMMISSIONER DEASON: Staff have a position on  
21 that?

22 MR. BERG: That really doesn't bother us too  
23 much because there is interest applied to it.

24 COMMISSIONER KIESLING: With that, then I  
25 would amend my motion to reflect that method for passing

1 it through to the customers.

2 COMMISSIONER DEASON: So the portion that is  
3 to be flowed through the clause would be part of the  
4 true-up in the next projection period and it obviously  
5 would earn interest during the intervening time period.

6 MR. BEASLEY: Yes, sir.

7 COMMISSIONER DEASON: And that is acceptable  
8 without objection?

9 COMMISSIONER JOHNSON: Yes.

10 COMMISSIONER DEASON: Show that would be the  
11 case.

12 All right, Issue 10C?

13 MS. BASS: Commissioner, Staff performed some  
14 calculations -- and I want to preface it by saying that  
15 these were definitely quick-and-dirty calculations. And  
16 rather than trying to go back and look at what the other  
17 parties have done and rebut their methods of calculating  
18 the change, Staff came up with a somewhat simple method  
19 to do it and it is something we would do if we were  
20 doing a sanity check. I am going to let Mr. Dudley  
21 explain to you exactly how the calculations were done.

22 COMMISSIONER DEASON: That's the term I was  
23 looking for the whole time, "sanity check."

24 MR. DUDLEY: I was requested to take and first  
25 replace the revised estimates for December and January

1 with actuals and see how that affected the factor. I  
2 did that for December and January and the revised factor  
3 would be 1.699, resulting in leaving the projected  
4 period alone, the April through September, FPL would  
5 recover 2.6% more than what is currently projected.

6 COMMISSIONER DEASON: This is total fuel costs  
7 including purchased power?

8 MR. DUDLEY: Total fuel costs including  
9 purchased power. All I did was, in the estimated actual  
10 amount, they have estimated fuel costs and every other  
11 component. What we did for those two months is simply  
12 go to the A Schedules which they file with us, replace  
13 the actuals where the revised were. And the fallout  
14 number, leaving the projected period alone, not  
15 adjusting it, it would result in a 2% overrecovery.

16 COMMISSIONER DEASON: Now that's just within  
17 the true-up calculation, right?

18 MR. DUDLEY: Yes, sir, and that carries  
19 forward -- leaving the projected costs alone.

20 COMMISSIONER DEASON: Okay.

21 MR. DUDLEY: Next, I was told to look at the  
22 recent trend that FPL has been overprojecting the cost  
23 of gas. We looked at the period October through  
24 January, October '94 through January '95. The average  
25 overestimation of gas cost has been 30.65%. What I did

1 then was, leaving the actuals for October, November,  
2 December and January, reduced the cost of gas in the  
3 total fuel costs as a component by this 30.65% in  
4 February and March. I also reduced the price of gas,  
5 the cost of gas, during the projected period by this  
6 same amount.

7           Doing that, if those new costs were being  
8 correct, FPL would currently, based on this, the current  
9 factor proposed would overrecover 21.9%.

10           COMMISSIONER DEASON: Based upon total fuel  
11 costs and purchased power?

12           MR. DUDLEY: Yes, sir.

13           If you take and look at the E3s or an A3, on  
14 that there is a total system cost for fuel. Gas is a  
15 component of that. Having determined this 30.65 trend  
16 of overprojection, we reduced that total cost for the  
17 gas by that amount. And then when you include all the  
18 components in the factor calculation, you wind up with a  
19 21.9% lower factor.

20           COMMISSIONER DEASON: So you're saying that,  
21 following the methodology which you just described, that  
22 you feel that there would be the need for a midcourse  
23 correction?

24           MR. DUDLEY: If you reduced the cost of gas by  
25 30.65%, assuming the new projections were correct, FPL

1 would be in a situation where they would be  
2 overrecovering beyond the 10%.

3 COMMISSIONER DEASON: Well, now, how did you  
4 calculate the 30.65 and how did you apply that to your  
5 calculation?

6 MR. DUDLEY: I calculated the 30.65 by going  
7 back to the October through January A Schedules, that's  
8 Schedule A3, and looking at the dollar per million Btu  
9 price per gas -- the A Schedules are actuals. On those  
10 A Schedules, they also include a column that says  
11 "Estimated." I think we've looked at several of these  
12 during the course of this hearing. And then like two  
13 columns over is a "Percent Difference" Column.

14 What we did is we summed up for October  
15 through January the actual cost. Then for October  
16 through January you sum up the estimated cost. You do  
17 your current calculation to wind up with 30.65 percent.  
18 Having found --

19 COMMISSIONER DEASON: All that shows is what's  
20 the difference between what they really projected and  
21 the actual for those four months, that doesn't mean that  
22 trend is going to continue.

23 MR. DUDLEY: No, sir, it doesn't. But what we  
24 were trying to find out is what was the recent trend?  
25 And with that recent trend, if it were to continue,

1 assuming that FPL would continue to overproject by  
2 30.65%, how would that affect their factor and would it  
3 put them in a position of overrecovery?

4 COMMISSIONER DEASON: I don't think even the  
5 intervenor position is there is going to be a continued  
6 overprojection of 30.65%, so that's what I'm having the  
7 difficulty with.

8 MS. BASS: We agree with that.

9 I was trying to find some way of looking at if  
10 we were to make an adjustment how would we to justify or  
11 base the adjustment on? It was my feeling if we looked  
12 at what the overprojections trend was with the actual  
13 price of gas and worked that through all the numbers  
14 with all the other components to get an idea of what  
15 trend was being set and, if we continued that trend,  
16 what the overrecovery would be or how close it would be  
17 to the midcourse correction.

18 I think we can look at what actual gas prices  
19 are, but I don't think that gives us -- or what other  
20 people are projecting gas prices to be, but I think we  
21 have already determined that Florida Power and Light's  
22 gas prices are in line with and lower than what other  
23 utilities are projecting. So I don't have other  
24 utilities to look at for their projections to say that  
25 they're closer and we should adjust to those

1 projections. So I was trying to get a trend going and  
2 seeing what impact, if this difference between actual  
3 and estimated continued to occur for the next eight  
4 months, how would that impact what the Utility is  
5 requesting for recovery?

6 COMMISSIONER KIESLING: I guess my question  
7 is, having done that quick, down-and-dirty, or whatever  
8 you call it, calculation, is Staff still comfortable  
9 with the position that it has taken that the estimation  
10 of natural gas prices is not unreasonably overstated and  
11 will not result in a midcourse correction?

12 MS. BASS: I don't think they're unreasonably  
13 overstated if you look at what other utilities are  
14 projecting. The problem with doing a calculation like  
15 this, or even putting in what the actual prices are and  
16 holding them constant for the next eight months, is that  
17 there are so many other factors involved in this that  
18 it's hard to say. The gas prices don't operate in  
19 isolation, there's so much more.

20 If I was to suggest that the trend has been  
21 30% and maybe we should reduce their gas prices by 15%,  
22 I'm not even sure that would be enough or that would be  
23 too much. It is very difficult when you are looking at  
24 projections to say whose are right and whose are wrong.

25 COMMISSIONER DEASON: Let me ask the question

1 this way. Is there any information that we have now  
2 that's in the record that was not available at the time  
3 the original forecast was made, just due to the time  
4 frames involved, that we know now that's in the record  
5 that would give us a basis to modify those projections  
6 so as to avoid a midcourse correction if we  
7 realistically feel that a midcourse correction would  
8 result?

9 MS. BASS: I think information that's in the  
10 record now would be the actual prices that the utility  
11 has paid for the months of December '94 and January of  
12 '95. When we redid our calculations just reflecting  
13 those two months of actuals versus what was estimated,  
14 it was essentially a 2.6% increase in the overrecovery,  
15 or compared to a 10% threshold, we were looking at 2.6%.

16 So no, based on the information that's in the  
17 record now on the actual amounts, I do not think we have  
18 enough to warrant recommending a change in projections.

19 COMMISSIONER DEASON: Okay, let me ask you  
20 this.

21 Within Florida Power and Light's original  
22 projection, are they estimating that the price of gas  
23 during the six months projection period will be trending  
24 up or trending down or staying steady?

25 MR. DUDLEY: I believe it's fairly steady up

1 through August and then you start seeing a bit of  
2 seasonality effect with it jumping in August and then  
3 jumping a little bit more in September.

4 COMMISSIONER DEASON: Now, if we were to take  
5 the actual '95 and apply that actual cost of gas during  
6 the projection period, using whatever trending that  
7 Power and Light is using in its projection, what would  
8 that result in? Or would that take some detailed  
9 calculations?

10 MR. DUDLEY: I'm sorry, could you say it  
11 again?

12 COMMISSIONER DEASON: We have January 1995  
13 actual data.

14 MR. DUDLEY: Yes, sir.

15 COMMISSIONER DEASON: That's the most recent  
16 actual data we have.

17 MR. DUDLEY: Yes, sir.

18 COMMISSIONER DEASON: Okay. If we were to  
19 take that, substitute that in as the price of gas during  
20 the projection period and adjust it by whatever trending  
21 Power and Light felt appropriate during the projection  
22 period -- if that was a trend up or steady or down,  
23 whatever -- and substitute that in with FP&L's projected  
24 price of gas, what would that do to the 10% threshold of  
25 a midcourse correction being necessary?

1 MR. DUDLEY: If you will give me a second just  
2 to look at the actual versus the starting point of  
3 projected? (Pause)

4 What I think that you asked is, if we took and  
5 reduced the starting point, that being February, to the  
6 point of being equal to the actual for January and then  
7 trended that out based on their assumptions, how would  
8 that affect the midcourse? Or how would it affect their  
9 recovery situation?

10 Given the fact that the actual for January is  
11 less than what they originally estimated it, I would  
12 have to say that it would put them in a position of  
13 overrecovery. The magnitude -- this is for January, it  
14 is a 23.6 reduction; so it would not be as significant  
15 as the 30.65 effect was.

16 It's not a linear relationship, so I  
17 couldn't --

18 COMMISSIONER DEASON: I understand that. If  
19 we were to assume just for the sake of argument that  
20 there is going to be a 23.6 reduction in the price of  
21 gas from the projections --

22 MR. DUDLEY: I'm sorry, Commissioner Deason.  
23 I looked, I saw January and assumed it was correct. For  
24 January of 95, it was a 37.1, so it would be even more  
25 significant.

1           COMMISSIONER DEASON: Even more than the 30.65  
2 that you calculated earlier?

3           MR. DUDLEY: Yes. I apologize for that.

4           COMMISSIONER DEASON: Okay. Well, I guess my  
5 bottom line question to Staff, I mean, this is a very  
6 complicated area and there are many relationships which  
7 exist between the various fuel types and generating  
8 mixes and things of that nature, and they're all kind of  
9 interdependent. With the further review that you have  
10 conducted in the information, is it your opinion that  
11 there's going to be the necessity of a midcourse  
12 correction using the information that was originally  
13 projected by Florida Power and Light?

14           MR. DUDLEY: By replacing the --

15           COMMISSIONER DEASON: No, I'm not talking  
16 about -- just do you think we're going to have to have a  
17 midcourse correction? I know I'm asking to you look in  
18 a crystal ball and that's a dangerous thing to do, but  
19 I'm asking for your opinion.

20           MR. DUDLEY: If I can give you a personal  
21 opinion, FPL does tend to overproject the price of  
22 natural gas. That opinion has been displayed by the  
23 Commission in the Ten-Year Site Plan and in other recent  
24 need determinations.

25           There is a chance that if FPL's projections

1 are overpriced there may be the need for a midcourse,  
2 say, probably in July or maybe August. But realizing  
3 that the midcourse is there and realizing that replacing  
4 it with actuals of what we know today only has a 3%  
5 effect, then I would suggest that we leave the factor as  
6 it is; and, if it becomes necessary, FPL can come in,  
7 say, midsummer, can file for a midcourse correction to  
8 avoid rate shock in the fall.

9 COMMISSIONER DEASON: Further questions,  
10 Commissioners?

11 COMMISSIONER KIESLING: Just one so I'm clear.

12 When you say Florida Power and Light may come  
13 in, are you saying that they must come in if it exceeds  
14 it, or it is permissible? I just want to be clear on  
15 how mandatory it is.

16 MS. BASS: According to the order on the  
17 midcourse correction, at 10% they must notify the  
18 Commission that they are in that position. It is up to  
19 the Commission to determine whether or not the utility  
20 needs to come in. Generally, the utility will  
21 request -- or the utility at 10% must notify the  
22 Commission; they may request to come in; the Commission  
23 may request them to come in; or another party to the  
24 proceeding may request them to come in. But at any  
25 point -- at the 10% they must notify the Commission.

1           COMMISSIONER KIESLING: And how long, what is  
2 the lag time between when it is actually, you know, paid  
3 and all of that and when they know that they have  
4 exceeded the 10%? I mean, for example, this is March.

5           MS. BASS: It depends on how quickly they  
6 filed it. In the past, we have turned these petitions  
7 around very quickly, understanding that the longer  
8 period of time any correction can be spread over, the  
9 better off the ratepayers are and the less rate shock is  
10 felt by the ratepayer.

11           Generally, what we do is we look at how long  
12 do we have left? But we can turn a petition around very  
13 quickly. And the utilities have been very responsive;  
14 and once they reach that 10% threshold, they immediately  
15 notify us. They keep up with it very closely.

16           COMMISSIONER KIESLING: And any party to this  
17 proceeding can also do it?

18           MS. BASS: Upon notification that they are in  
19 that situation, any party can request that they come in.

20           I don't think in the past any utility has  
21 notified us -- they have notified us and requested to  
22 come in at the same time.

23           COMMISSIONER DEASON: The problem is that,  
24 obviously, the utility keeps up with it and has access  
25 to the most current information; and they would know

1 when they start approaching the 10% threshold long  
2 before any intervenor could conduct discovery and get  
3 the information.

4 MS. BASS: Exactly. We would not be aware of  
5 it until they actually filed their A Schedules, which  
6 are due the 20th of the following month after the  
7 reporting month.

8 COMMISSIONER JOHNSON: Let me ask one final  
9 question, then, just to make sure I understand Staff's  
10 position.

11 I know we were dealing with estimates and some  
12 information is provided in the record to give us some  
13 actual information. But what I think you all are saying  
14 is, even given the actual information now in the record,  
15 that that, what we have thus far, is insufficient to  
16 change your analysis for you to feel comfortable  
17 concluding that the estimation of natural gas would be  
18 overstated?

19 MS. BASS: Based on the information in the  
20 record, yes.

21 COMMISSIONER JOHNSON: Could there ever be an  
22 instance where the actual information could indeed wave  
23 a red flag for you all to say, "Wait, we need to do  
24 something now"? Or is this a position where we're  
25 always going to be in this predicament -- (Simultaneous

1 conversation)

2 MS. BASS: -- if we have actual information,  
3 we review that on a monthly basis as it is filed. We're  
4 continuing to look at those.

5 And the projections, although we look at the  
6 projections and their impact on the ratepayers and we  
7 compare them among the utilities -- which the utilities  
8 generally don't prefer us not to compare  
9 utility-to-utility. But we do look at the projections  
10 and see whether or not they're reasonable based on the  
11 estimates that other utilities are making and other  
12 publications that we get. But estimates are just that;  
13 and I think we've always recognized that, that they're  
14 going to be wrong.

15 COMMISSIONER JOHNSON: And didn't you -- I  
16 don't know which, perhaps you -- stated that Florida  
17 Power and Light's estimates were, with respect to a  
18 relative analysis to the others, lower? I don't know if  
19 that was in the record or where I got that note from.

20 MS. BASS: I think that Florida Power and  
21 Light's witness stated that theirs was lower. I believe  
22 we stated that based on the review that Staff had that  
23 they were within the reasonableness range of the other  
24 utilities.

25 COMMISSIONER DEASON: At what point would the

1 actuals have to be so different from the projections  
2 that Staff would come in and say, "This is unreasonable  
3 and we need to do something now to ensure that we're not  
4 going to have to have a midcourse correction as we enter  
5 the new projection period"?

6 MS. BASS: I guess I would have the default to  
7 the 10%. If we saw a utility getting close to that,  
8 based on the information that they were filing with us  
9 on the actual fuel schedules, I think at that point we  
10 would call the utility and ask them, you know,  
11 "According to our information, you're getting pretty  
12 fairly close. Have you done an analysis of this?" and  
13 see what point they were at. Whether or not they had  
14 projected the information that at one month they may be  
15 9% but they have information available that their  
16 transportation costs or something else are going to  
17 decrease in the next month which will take them and move  
18 that midcourse correction percentage the other way. So  
19 they're thinking that they may be 9 now, but next month  
20 they're going to be back down to 5.

21 So I think it is something that they look at  
22 on a continual basis. And we would look at it. And I  
23 think we've called them before and asked them, "You're  
24 getting close, it's getting up there, are you looking at  
25 it?" But I can't say that we have a set percentage that

1 we initiate any type of action.

2 COMMISSIONER DEASON: Well, no, no. I  
3 understand that. I guess that's during -- once we enter  
4 into the current recovery period and the monitoring that  
5 goes on. My question is, at the stage we're in right  
6 now, at what point would -- in this case, natural gas or  
7 any other fuel, but probably natural gas, because it  
8 seems to be more volatile than other fuels -- at what  
9 point would the current trend or the current prices of  
10 natural gas have to be different from what was projected  
11 that it would cause you all to come to us and say, you  
12 know, "These were projections and they were fine when  
13 they were projected, but we know now something has  
14 happened in the intervening time period and we know that  
15 those projections are going to be wrong and it is  
16 probably going to cause a midcourse correction. And we  
17 need to make corrective fine-tuning now to prevent that  
18 from happening during the actual recovery period"?

19 I take it we have not reached that, it is not  
20 the situation here; but it seems to me at some point  
21 something could happen to where it would be necessary  
22 for us, sitting in the mode that we are right now, to  
23 make a change.

24 MS. BASS: I think if we had come to this  
25 point and, instead of having this 3% or 2.6%

1 differential, that now we know that we had  
2 projections -- because time has passed since they filed  
3 the projections we now have actuals to compare it to --  
4 if we had gotten those actuals in and it showed that  
5 there was a substantial difference between the actual  
6 and the projections and now we were sitting in a  
7 projection period, then I think Staff would recommend  
8 that the projections need to be changed and we need to  
9 adjust the factor to reflect the actual information  
10 that's available.

11 Am I missing?

12 COMMISSIONER DEASON: No, no, I just --

13 MS. BASS: I think --

14 COMMISSIONER DEASON: -- I want some assurance  
15 that during our procedures and our review that if we  
16 feel that the utility's projections are off -- through  
17 no fault of their own, just maybe because of some  
18 catastrophic event happened between the time they made  
19 their original projections and we're sitting here today  
20 looking at those -- that we can catch those and we are  
21 capable of making those adjustments so that the actual  
22 factors that are charged to customers at the beginning  
23 of the current recovery period are such that hopefully  
24 we will avoid a midcourse correction.

25 MS. BASS: I think Staff does that on an

1 ongoing basis. When we do get the actual information,  
2 we compare it to what was estimated to see whether or  
3 not we are getting close to that point.

4           As I stated earlier, the utilities will  
5 also -- if when they file their information with two  
6 months of actual data and four months of estimated and  
7 then and additional six months projected, as we get  
8 closer to the hearing and that actual information  
9 becomes available, if it has a significant impact on the  
10 fuel factor, the utility will substitute full data for  
11 estimated data as close up to the hearing as we can get  
12 and still provide positions. And we have done that on a  
13 number of times ended up with four months of actual and  
14 two months estimated and then six months projected,  
15 instead of two/four the other way.

16           So we try to continually update it, especially  
17 if it is going to have an impact on the fuel factor.

18           COMMISSIONER DEASON: Further questions? Is  
19 there a motion?

20           COMMISSIONER KIESLING: I move Staff, with the  
21 understanding that if there is an overearnings situation  
22 which presents itself, that we will do what we need to  
23 do to get the utility in here as quickly as possible to  
24 adjust for that.

25           COMMISSIONER JOHNSON: Second.

1           COMMISSIONER DEASON: We have a motion and  
2 second.

3           Let me say that this is a very -- here, again,  
4 it is a difficult area. Once again, it is looking into  
5 a crystal ball, and none of us can do that with 100%  
6 accuracy.

7           I'm comforted to some extent that our Staff  
8 has looked at it thoroughly and they're still not  
9 convinced there's going to be a necessity for a  
10 midcourse correction. I think that obviously Power and  
11 Light has looked at this. I don't think that Power and  
12 Light has an incentive to overrecover or underrecover,  
13 and that it is in their own interests to try to make it  
14 as accurate as possible. They don't think that any  
15 adjustments need to be made.

16           And I think that we have encouraged our Staff,  
17 as well as the parties, particularly in this case  
18 Florida Power and Light, to keep a very close watch on  
19 this; and if it does appear there is going to be the  
20 necessity of a midcourse correction, that we can do it  
21 as quickly as possible so that the magnitude of the  
22 correction can be minimized.

23           For those reasons, I can support the motion.

24           We have a motion and a second. All in favor,  
25 say aye. Aye.

1 I believe that motion carries unanimously.

2 MS. BASS: Commissioner, I assure you we will  
3 keep a close eye on this and track these costs.

4 COMMISSIONER KIESLING: Yeah. I just wanted  
5 to assure you I don't have any doubts of that; and by my  
6 questions and statements, I'm not implying that you  
7 don't do that.

8 MS. BASS: Thank you.

9 COMMISSIONER DEASON: That conclude all  
10 matters?

11 MS. BROWN: I think that does, Commissioner, I  
12 think we're finished.

13 COMMISSIONER DEASON: Okay. The hearing is  
14 adjourned. Thank you all.

15 (Thereupon, the hearing concluded at 1:00  
16 p.m.)

CERTIFICATE OF REPORTERS

4 We, JOY KELLY, CSR, RPR, Chief, Bureau of  
 5 Reporting, SYDNEY C. SILVA, CSR, RPR, and ROWENA NASH  
 6 HACKNEY, Official Commission Reporters,

7 DO HEREBY CERTIFY that the Hearing in Docket  
 8 No. 950001-EI was heard by the Florida Public Service  
 9 Commission at the time and place herein stated; it is  
 10 further

11 CERTIFIED that we stenographically reported  
 12 the said proceedings; that the same has been transcribed  
 13 under our direct supervision; and that this transcript,  
 14 consisting of 543 pages, Volumes 1 through 4 inclusive,  
 15 constitutes a true transcription of our notes of said  
 16 proceedings.

DATED this 15th day of March, 1995.
