RE: DOCKET NO. 960527 - FLORIDA POWER \& LIGHT COMPANY REQUEST FOR APPROVAL OF SITE SPECIFIC DEPRECIATION STUDIES

AGENDA: OCTOBER 8, 1996 - REGULAR AGENDA - PROPOSED AGENCY
CRITICAL DATES: NONE
SPECIAL INSTRUCTIONS: S:\PSC\APA\WP\260527EI.RCH

## DIscussion or Issues

ISSUE 1: What are the appropriate depreciation rates for Florida Power \& Light's (FPL or Company) investment relating to combined cycle units?

RECOMMENDATION: The appropriate depreciation rates for investment relating to the FPL combined cycle generating plants are listed on Attachment A, pages $7-9$. These are the same rates approved for preliminary implementation in this docket at the Agenda conference held March 5, 1996. For information, the preliminary implementation resulted in an increase of approximately $\$ 20.4$ million relating to depreciation expense, based on actual January 1, 1996 investments. The amortization of any related investment tax credit, or flowback of any deferred income tax credit, should be adjusted accordingly. (BASS, HICKS)

STAPF ANALYEIS: FPL operates combined cycle units for power generation at three sites: Fort Lauderdale, Martin and Putnam. As part of the initial filing in this docket, the Company requested preliminary implementation of its proposed rates for those units

DOCKET NO, 960527-EI
DATE: September 26, 1996
at January 1, 1996. Preliminary implementation was granted by Order No. PSC-96-0841-FOF-EI, issued July 1, 1996. Staff has completed the review of FPL's proposals and has found them to be reasonable.

Primarily, the Company requested the change in depreciation rates in response to two developments. First, FPL has completed the process of classifying plant in service to the retirement unit level for each location. Prior to the completion of this unitization project, the best available information was an estimate of investment by account, based on final construction reports obtained from contractors.

Second, expectations for both performance and life characteristics relating to the combined cycle installations are changing as a result of actual operating experience. These installations include some "leading edge" applications of technology. There is no "full life cycle" history for some of the equipment involved, which is to say that no similar installations have been in service long enough to establish expectations for performance or life patterns. Design improvements and retrofit solutions to problems are part of the routine operation.

Staff concludes that the Company proposed depreciation rates are a reasonable and conservative response to these developments, based on review of information currently available. The components shown on Attachment A are those proposed by FPL, including the book reserve percentage calculated to a single decimal place. Although it is staff's standard practice to use two decimal places for reserve percentage calculation, our review indicates that the proposed depreciation rates are reasonable and we recommend their acceptance. Following is a discussion of primary points of the review.

The unitization process includes physical ver fication of systems, as well as the reconciliation of indirect construction costs and overheads. This process supports a high level of confidence in the resulting account balances, which for some accounts differ significantly from the estimates previously available. The resulting records can provide a sound basis for assessment of future trends.

[^0]DOCKET NO. 960527-EI
DATE: September 26, 1996
temperatures in excess of 2300 degrees $F$ have allowed for the attainment of a net heat rate in the range of $7,100 \mathrm{BTU} / \mathrm{KWH}$.

These achievements have come at a price, as documented by other aspects of the operation. In the second situation, problems developed with the heat recovery steam boiler tubes, resulting from the impact of high temperature gas exhaust from the turbines; and, third, the row one turbine blades will require additional maintenance procedures, as compared to design planning. The boiler tube situation required retrofit design modifications soon after operation began, but unit function was restored.

From the record developed thus far, it cannot be ascertained whether these changes in life parameters and depreciation rates are adequate to match investment recovery with the life of the related equipment. The questions which naturally arise from these circumstances can only be answered in the future, as more experience is gained from the operation of installations such as these. The activity and planning related to these installations should be carefully monitored, so that appropriate action can be taken as soon as revisions in capital recovery needs are indicated. Monitoring should include not only maintenance and replacement records, but comparisons with newer technologies which may dictate obsolescence. More so than ever before, the current state of the power industry strongly indicates that investor owned utilities cannot afford any delay in responding to capital recovery needs.

Further, revision of a utility's depreciation rates usually results in a change in its rate of ITC amortization and flowback of excess deferred income taxes of the related investment. Section $46(f)(6)$ of the Internal Revenue Code (IRC) states that the amortization of ITC's should be determined by the period of time used in computing depreciation expense for purposes of reflecting regulated operating results of the utility. Therefore, it is also appropriate to change the amortization of ITC's, in those instances where amortization of ITC's exist.

Section 203 (e) of the Tax Reform Act of 1986 (TRA) prohibits rapid writeback of protected (depreciation related) deferred taxes. In addition, Rule $25-14.013$, Accounting for Deferred Income Taxes under SFAS 109, Florida Administrative Code (F.A.C.) prohibits, without good cause shown, excess deferred income taxes associated with temporary differences from being reversed any faster than allowed under Section 203 (e). Therefore, both the TRA and Rule 2514.013, F.A.C., prohibit faster write-off of protected excess deferred taxes. Consequently, staff believes that the flowback of excess deferred taxes should be altered to comply with the TRA and Rule 25-14.013, F.A.C.

DOCKET NO. 960527-EI
DATE: September 26, 1996

If FPL is currently amortizing ITC's and/or flowing back excess deferred income taxes related to the above-mentioned combined cycle units, the utility should make an adjustment to reflect the new depreciation rates. The adjustment to the amortization of ITC's and/or the flowback of excess deferred taxes should be reflected in the next surveillance report.

The estimated increase to depreciation expense: by plant site, based on January 1, 1996 investments, are as folloss:

Fort Lauderdale Martin Putnam

Total
$\$ 15.1 \mathrm{M}$
$\$ 4.2 \mathrm{M}$
$\$ 1.1 \mathrm{M}$
\$ 20,4M

DOCKET NO. 960527-EI
DATE: September 26, 1996

I8SUE 2: What is the appropriate amortization period for FPL investment related to personal computer equipment?

RECOMMENDATION: The appropriate amortization period for this investment is three years, based on Company planning. Based on estimated 1996 purchases, an annual increase of approximately $\$ 2 \mathrm{M}$ in amortization expense results. (BASS)

STAFP ANALYBIS: Currently, all investment relating to computer equipment is amortized over a five year period. While this is considered adequate for mainframe type equipment, the company's operations and planning imply an alternate pattern for personal computer type equipment.

Throughout its operations, FPL utilizes software packages which are continually subject to update. The 386 technology which was standard for 1990 technology became obsolete with the coming of 486 technology in 1992-1993. Replacement by the next generation, the Pentium chip, is already underway; and the next generation is over the horizon. This process is expected to continue indefinitely. The proposed three-year amortization period is appropriate as a reasonable match of recovery period with useful life.

By this recommendation, the personal computer type equipment purchased on or after January 1, 1996, will be subject to this three year amortization. Based on estimated 1996 purchases, the change in amortization period will increase the annual accrual by approximately $\$ 2 \mathrm{M}$. This increase in annual accrual was included in the preliminary implementation, approved March 5, 1996.

DOCKET NO. 960527-EI
DATE: September 26,1996

ISSUE 3: What should be the implementation date of the recommended rates and amortization?

RECOMPENDATION: Staff recommends approval of the Company's proposed January 1, 1996, date of implementation for the depreciation rates and amortization. (BASS)

STAFF ANALYEIS: Company data and related calculations abut the January 1, 1996, date. Since the Company's request for preliminary implementation of the proposed rates and amortizations at that date was granted, the accruals will continue at the same level, upon approval of this recommendation.

Issue 4: Should this docket be closed?
RECOMMENDATION: Yes. If no substantially affected person timely files a protest to the commission's notice of proposed agency action, this docket should be closed. (BASS)

STAFF ANALYgIg: If no substantially affected person files a timely request for a Section 120.57 , Florida Statutes, hearing within twenty-one days, no further action will be required and this docket should be closed.
