Tallahassee, FL 32399-0850

Re: Load Research Report - Tampa Electric Company

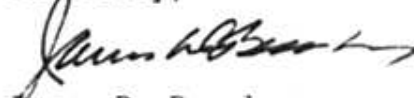

Dear Ms. Bayo:

In compliance with Rule 25-6.0437 enclosed are five copies of Tampa Electric Company's Load Research Report.

Please acknowledge receipt and filing of the above by stamping the duplicate copy of this letter and returning same to this writer.

Thank you for your assistance in connection with this matter.

Sincerely,

James D. Beasley

FPSC-RECORDS/REPORTING

REPORTING PERIOD

The data summarized in this report was collected during the calendar year 1997. The sample points were selected prior to 1997, and in most cases the recording equipment was installed prior to January 1, 1997. Some sample points in each of the classes were replaced for various reasons during the year resulting in partial years of data collection for these Customers.

SAMPLING PLAN

The plan for this load research project was formulated and filed with the Florida Public Service Commission in August of 1996.

RESIDENTIAL CLASS SAMPLE

The residential sample was pre-stratified by housing type. The three housing type categories are single-family-detached, multi-family, and mobile-home. The primary reasons for using this stratification are that the load patterns for the three housing types are dissimilar and that the percentage of mobile homes in the population changes significantly with the seasons. The percentage of mobile homes ranged from a high of 13.3% in the winter to a low of 12.4% in the summer. The housing type stratification allows corresponding changes to be made in stratum weights (since inter-strata migration is insignificant) on a month by month basis when estimating class demands. The estimated demands thus reflect the seasonal changes in the housing type mix. The sample points were allocated to the strata using Neyman allocation with stratum variances estimated from previous sample results. A minimum sample size of 50 was used in the Multi Family and Mobile Home categories. The resulting sample allocation is shown below.

Stratum	Sample Size
Single Family Detached	175
Multi Family	50
Mobile Home	50
Total	275

GENERAL SERVICE NON-DEMAND CLASS SAMPLE

The stratification variable used for the General Service Non-Demand sample was annual kilowatt-hour consumption at the time of sample selection. The sample was selected in 1996. The stratum boundary for the sample was annual usage below 15,000 kwh and usage of 15,000 kwh and above. The sample points were allocated to the strata using Neyman allocation with stratum variances estimated from previous sample results. The allocation is shown below.

Stratum	Sample Size
0 - 14,999	257
15,000 - infinity	243
Total	500

GENERAL SERVICE DEMAND CLASS SAMPLE

The stratification variable for the General Service Demand Class was the highest billed demand in twelve months prior to sample selection. In cost of service study work, class demands must be split into voltage level totals. To facilitate this splitting, a stratum of all Customers served at primary voltage and another stratum of Customers served at secondary voltage but metered at primary voltage were established. For secondary voltage Customers the stratum boundaries were 200 kw and 700 kw. All Customers over 700 kw were included in the sample in a 100% sampled stratum. Any Customers subsequently exceeding this threshold had recorders installed on their meters and were included in the sample as well. The sample points in the two sampled strata for the GSD Class were allocated using Neyman allocation. The allocation is shown below and reflects totals in the 100% sampled strata as of December 1997.

Stratum	Sample Size
Primary Metered/Primary Served	73 (100%)
Primary Metered/Secondary Served	37 (100%)
Secondary under 700 kw	
0 - 199 kw	70
200 - 699 kw	70
Secondary over 699 kw	149 (100%)
Total	399

GENERAL SERVICE LARGE DEMAND CLASS SAMPLE

The General Service Large Demand Class has recorders installed on each Customer. For cost of service study work the Customers are divided into voltage level categories. On a month by month basis, as Customers migrate into and out of the GSLD rate, the analysis population is changed accordingly. The population size as of December 1997 was 153.

INTERRUPTIBLE SERVICE CLASS SAMPLE

The Interruptible Service Class has recorders installed on each Customer. For cost of service study work the Customers are divided into voltage level categories. On a month by month basis, as Customers migrate into and out of the IS rate, the analysis population is changed accordingly. The population size as of December 1997 was 74.

STUDY METHODOLOGY

Following sample design, the load research study consists of four phases: data collection, editing, storage and analysis. The methodology used in these phases for this study is basically the same as has been used in the past at Tampa Electric Company.

DATA COLLECTION

Once sample sizes, stratum definitions, and sample allocations have been determined, sample selection is ready to begin. In general, for the sampled classes, random numbers are assigned to the members of the class, and the list of Customers is sorted in ascending order by the assigned random number. The first group of Customers on the list is the prime sample, while the following group is used as a source of replacement Customers. The replacement list is maintained in random order and is used in that order on an as needed basis. For Customers selected, the standard billing watt-hour meter is replaced with a pulse-initiating type meter, and a recording device is installed to collect and retain the pulse information in fifteen minute intervals. The recorded information is collected, usually on a monthly basis, and processed through a translation system located in the Meter Department. Periodically the translation system produces transfer files which are uploaded to the company's mainframe computer and subsequently input into the LODESTAR System. Data entered into LODESTAR goes through a preliminary screening to determine its acceptability. Unacceptable data is examined by analysts to see if any portion of the data is useable and if any data editing is required. The data is flagged to indicate whether it is suitable for analysis purposes and is then stored permanently on magnetic tape.

DATA ANALYSIS

The data flagged as acceptable in the LODESTAR System is then processed through software modules capable of performing stratified or un-stratified mean-per-unit, combined ratio or separate ratio analysis. The analyses are run on a calendar month basis and produce statistics at the class level and at the per-Customer level. For Tampa Electric Company the best results for sampled classes are obtained through the use of combined ratio expansion. Since the 100% sampled classes do not require statistical expansion, the results for these classes are tabulated with the mean-per-unit module.

SAMPLE POINT REPLACEMENT

Initially and during the course of the load research study, sample points must be replaced. To minimize the amount of replacement necessary, Tampa Electric's policy is not to request permission from Customers before recorders are installed. During the sampling period, 111 replacements were required and were done for the following reasons: Rate Changes (36), demolitions (4), extended periods of suspense (30), Customer dissatisfaction or installation problems (41). In all cases the replacements were selected randomly from Customers in the same stratum. The assumption necessitated as a result of making these replacements is that no significant bias is introduced into the results in the process. Particularly since the combined ratio expansion technique was used for the analysis phase in the sampled classes, the assumption is reasonable.

RESULTS

The following tables report the class coincident and non-coincident demands and their related precision for the calendar year 1997. The precisions are calculated at the 90% confidence level. The hourly demands for the Residential Class for the entire year of 1997 are reported in the Appendix. The winter system coincident peak occurred on January 19, 1997 at 09:00, and the summer coincident peak occurred on May 27, 1997 at 17:00. Estimates for the RS, GS and GSD classes were more accurate than the target accuracy specified by the Load Research Rule for summer and winter coincident peak and for the average of twelve coincident peaks.
