INTRODUCTION

1

22

23

2		
3	Q.	PLEASE STATE YOUR NAME AND BUSINESS ADDRESS FOR THE
4		RECORD.
5	A.	My name is Sidney L Morrison. My business address is 10176 Savannah
6		Sparrow Way, Highlands Ranch, Colorado 80129.
7		
8	Q.	PLEASE SUMMARIZE YOUR PROFESSIONAL EXPERIENCE.
9	A.	I began my telecommunications career in 1966 in Charlotte, North Carolina as a
10		cable helper for Southern Bell Telephone and Telegraph. Southern Bell was an
11		incumbent local exchange carrier managing numerous exchanges throughout
12		North Carolina (Southern Bell later became a component of the BellSouth
13		organization). My duties involved splicing underground, buried and aerial cable.
14		I also worked as a switching technician and special services technician.
15		
16		Beginning in August of 1970, I transferred to Mountain Bell in Denver, Colorado
17		as a central office technician. In 1972, I was promoted to supervise main
18		distributing frame operations. My duties included supervising the installation of
19		plain old telephone service (POTS), special services, central office area cuts, main
20		distribution frame replacements and many other projects. In 1980 and 1981 I was
21		assigned to perform time and motion studies for service provisioning on

approximately 75 of Mountain Bell's MDF operations. These time studies

included components for provisioning local exchange services via "jumper

running" as well as administrative activities on each of these frames. From 1983 until 1986 I was the switching control center and main distributing frame subject matter expert for US West. In this position I was responsible for staff level support for service provisioning and maintenance including the development of enhancements for operational support systems (OSS) supporting numerous provisioning activities. From 1986 until 1993, I was responsible for the US West Automated Message Accounting (AMA) teleprocessing organization for the fourteen state US West region.

In 1993, I retired from US West (Mountain Bell) and began my consulting career. In 1995 I took an assignment in Kuala Lumpur, Malaysia as a contract/consultant with a team of specialists building an ALEC network consisting of Global System for Mobil Communications (GSM) services, fixed network services, cable television services and data services integrated into a common Synchronous Digital Hierarchy (SDH) transport backbone.

I had a number of responsibilities in Malaysia, the largest of which was organizing and implementing a Facilities Management Center (FMC) which controlled the installation and maintenance of all fixed telecommunications network and cable television services. My responsibilities included the planning, organizing, staffing and implementation of the FMC, including an installation and maintenance group, assignment center, dispatch center, test center and a repair

1 center. I was also responsible for developing business processes and OSS 2 requirements for provisioning and maintenance supporting the FMC. 3 4 After launching the FMC, my responsibilities included general management as 5 well as an initiative aimed at refining the FMC center for purposes of achieving ISO 9002ⁱ qualified status. In January 1997, under my supervision, the Binariang 6 7 Maxis FMC became the first certified ISO 9002 service organization in Southeast 8 Asia. 9 10 I returned from Malaysia in June of 1997 and worked for approximately two years 11 as a contract OSP/COE engineer for US West. In those positions I was 12 responsible for training telecommunications engineers on collocation procedures 13 and policies in US West's service territory. 14 15 In May 1999 I accepted a contract in Switzerland building a new Alternative 16 Local Exchange Carrier (ALEC) under the market name of diAx 17 telecommunications. My responsibilities involved project management to 18 establish an OSS platform supporting all wireless, wire line, and data services 19 offered by the company. I also developed business processes supporting the 20 establishment of the diAx Internet Provider Operations Center (IPOC) and diAx 21 data services offerings. I established system requirements based on IPOC 22 business processes for fault management systems, provisioning systems, capacity

inventory systems, customer service inventory systems and workflow engines controlling overall maintenance and provisioning processes.

In December 2000, I returned from Switzerland and accepted a position with QSI as a Senior Consultant. My primary responsibility with QSI involves providing QSI's telecommunications clients with engineering advice and counsel for network planning, management and cost-of-service support. My specific areas of expertise include network engineering, facility planning, project management, business system applications, incremental cost research and issues related to the provision of unbundled network elements.

Finally, and most specific to my testimony in this proceeding, I have, over the last 30-plus years of my career, had continuous hands-on experience with the work activities associated with provisioning local exchange facilities/services, data services, cable television services, wireless networks, switch-based services, central office cross connection, field installation and maintenance and outside plant planning and engineering.

Α.

Q. PLEASE DESCRIBE YOUR EDUCATIONAL BACKGROUND.

I completed two years of course work in electrical engineering at Central

Piedmont Community College in Charlotte, North Carolina. I also completed
four years of course work in business administration at Regis University in

Denver, Colorado. Throughout my career I have attended numerous industry

seminars and vendor training courses on telecommunications technology and
business processes. In 1961 I attended the US Air Force Electronics training
school and Nuclear Weapons Reentry Vehicle School at Lowry AFB, Denver,
Colorado.

Q. WHO ARE THE CLIENTS FOR WHICH YOU ARE FILING

7 TESTIMONY IN THIS CASE?

8 A. I am filing this testimony on behalf of the "ALEC Coalition." That coalition is
9 comprised of AT&T of the Southern States, MCImetro Access Transmission
10 Services, LLC, MCI WorldCom Communications, Inc., and Florida Digital
11 Networks.

PURPOSE AND SUMMARY

14 Q. PLEASE DESCRIBE THE PURPOSE OF YOUR TESTIMONY.

A. I was asked by the ALEC Coalition to review the cost support provided by

Verizon Florida (hereafter "Verizon") in an effort to assess the reasonableness of

Verizon's proposed non-recurring costs (NRCs). My testimony describes for the

Commission the rigorous process I have undertaken in reviewing Verizon's cost

model and also identifies a number of areas wherein I believe Verizon's NRC cost

model includes unreasonable assumptions resulting in NRCs substantially higher

than would be expected in an efficient provisioning operation. Further, this

testimony includes a number of recommendations that the Commission should

rely upon in revising Verizon's proposed NRCs. All of my criticisms and

1		recommendations included in this testimony are based upon my extensive
2		experience (1) building provisioning systems and organizations responsible for
3		performing these exact same functions, (2) analyzing efficient processes and
4		methods by which to improve performance with respect to these same activities,
5		and (3) actually performing these same functions in the business environment.
6		
7	Q.	WHAT ISSUES ARE YOU ADDRESSING IN YOUR TESTIMONY?
8	A.	As noted above, I am addressing Verizon's NRC studies and results.
9		Specifically, I am addressing portions of Issue 8 as was described in the
10		Commission's "Order Establishing Procedures Phase III" dated August 2, 2001 in
11		this proceeding. Issue 8 was defined as follows:
12 13 14		Issue 8: What are the appropriate assumptions and inputs for the following items to be used in the forward-looking non-recurring UNE cost studies:
15 16 17 18 19 20 21 22		 (a) Network design; (b) OSS design; (c) Labor rates; (d) Required activities; (e) Mix of manual versus electronic activities; (f) Other.
23	Q.	DOES YOUR TESTIMONY INCLUDE ANY INSTANCES WHEREIN
24		YOU WERE ABLE TO RECALCULATE VERIZON'S NRC CHARGES
25		AND ACTUALLY PROVIDE THE COMMISSION WITH ALTERNATIVE
26		PROPOSED RATES?
27	A.	Yes. After many hours analyzing and attempting to understand the inner-
28		workings of Verizon's overly-complex NRC model. I was able to actually

recalculate 7 individual NRC elements by substituting reasonable assumptions and inputs where Verizon had included unrealistic, and overstated time, effort and manual processes. The following table identifies those elements and compares Verizon's proposed NRCs with the NRC estimates calculated by re-running Verizon's model with more reasonable assumptions:

	Proposed by Verizon		Calculate	d by SLM
	Manual	Semi-Mech	Manual	Semi-Mech
I. Unbundled Loop				
Exchange-Basic-Initial				
Ordering	\$56.07	\$36.91	\$29.81	\$19.23
Service Connection	\$102.84	\$100.23	\$19.00	\$9.24
II. Unbundled Port				
Exchange-Basic-Initial				
Ordering	\$51.54	\$32.28	\$21.24	\$10.66
Service Connection	\$45.68	\$44.84	\$8.83	\$4.49
III. Enhanced Extended Link (EEL)				
Initial				
Ordering	\$174.68	\$115.54	\$45.01	\$30.93
Service Connection	\$931.87	n/a	\$294.11	n/a

7 Q. WERE YOU ABLE TO RECALCULATE ALL OF VERIZON'S NON-

RECURRING CHARGES FOR PURPOSES OF PROPOSING

ALTERNATIVE RATES FOR ALL VERIZON NRCS?

10 A. No. As I describe in greater detail below, the Verizon cost models are remarkably
11 cumbersome and simply threading through the myriad of Verizon spreadsheets in
12 an effort to trace the calculation of a single NRC element requires hours.
13 Unfortunately, given limited time and resources I was able to completely trace,
14 analyze and review -- in detail sufficient to recalculate an alternative rate -- only
15 those rate elements included in the table above.

1	Q.	ABSENT YOUR ABILITY TO RECALCULATE ALL OF VERIZON'S
2		PROPOSED NONRECURRING CHARGES, SHOULD THE
3		COMMISSION SIMPLY ADOPT THE REMAINING VERIZON
4		PROPOSALS?
5	A.	No. I believe it would be a mistake to assume the remaining NRCs are accurate
6		or just and reasonable. My review of Verizon's cost models indicates a number
7		of systemic problems that are present throughout the calculation of its NRC rates.
8		It is for that reason that I make the following two-part recommendation. Where I
9		have been able to completely recalculate an NRC by using Verizon's own model
10		with revised assumptions and inputs, I would recommend that the Commission
11		adopt my proposed alternative rate. However, where I have not been able to
12		completely recalculate an alternative rate, I have calculated a "reduction factor"
13		that the Commission should apply to those remaining rates to rid the NRC results
14		of the systemic overestimation caused by the Verizon analysis.
15		
16	Q.	CAN YOU BE MORE SPECIFIC WITH RESPECT TO YOUR
17		RECOMMENDATION THAT THE COMMISSION APPLY A
18		"REDUCTION FACTOR" TO THE NRC ELEMENTS YOU HAVE NOT
19		BEEN ABLE TO RECALCULATE?
20	A.	In the remainder of my testimony I draw the Commission's attention to the
21		numerous methodological and assumption errors inherent within the Verizon
22		NRC cost model. In the table above I provide the Commission with actual rates
23		(for a limited number of elements) that would result if those errors were corrected.

In performing this analysis (and from my in-depth review of Verizon's model) I have developed a very good sense of the inherent magnitude by which the Verizon cost model overestimates actual, forward-looking NRCs. Based upon my analysis, it is readily apparent that Verizon's cost model overstates ordering charges by approximately 50% and overstates provisioning charges by more than 66%. That is, if the Commission were to reduce all Verizon NRCs specific to ordering activities to 50% of Verizon's proposed rate, and all NRCs specific to provisioning activities to 33% of Verizon's proposed rate, the resulting rates, while likely still overstated, would be much closer to the economic, forward-looking costs. I recommend that the Commission apply these two reduction factors to all NRCs that I have been unable to recalculate.

COST MODEL ANALYSIS

14 Q. WHAT IS YOUR OVERALL IMPRESSION OF THE VERIZON NRC15 MODELS?

A. In general, the Verizon NRC models appear to be needlessly complex. Many work steps often appear to be unnecessary, duplicative, or both. The work times are largely unsubstantiated and are based on numbers of observations of work activities that have no supporting documentation. Further, those numbers of observations are multiplied by a number of minutes for which there is no support. My overall impression is that the Verizon study should not be relied upon in its present state to set rates for NRCs in the State of Florida.

1	Q.	IN ADDITION TO YOUR REVIEW OF VERIZON'S NRC MODEL, ARE
2		THERE OTHER INDICATIONS THAT SOMETHING IS WRONG WITH
3		VERIZON'S PROPOSED NRCS?
4	A.	Yes, there are. A simple comparison of Verizon's proposed NRCs with those
5		proposed and/or adopted by state commissions around the country (including the
6		Florida Commission) yields results that strongly suggest Verizon has made a

Florida Commission) yields results that strongly suggest Verizon has made a mistake. For example, draw a comparison between the proposed Verizon charges to migrate an ALEC customer to the Unbundled Network Element Platform (UNE-P) with BellSouth's charges for the same service. Verizon proposes to charge as much as ** ** to order the migration and an additional ** ** in service connection charges per line migrated (a total of \$24.88). This compares to charges approved for BellSouth in Phase A of this docket of \$1.52 (Pg 64, line N.1.1) to order the migration and an additional \$0.102 (pg 66, line P.1.1) in service connection charges per line migrated (a total of \$1.622). This is but one example of where Verizon's NRCs exceed those adopted for BellSouth by

enormous percentages.

While BellSouth is indeed a large ILEC and Verizon will undoubtedly argue that its operations in Florida are smaller, thereby resulting in less efficiency and higher costs, the Commission should remember that Verizon is the largest ILEC in the United States. In his testimony, Dr. August Ankum provides a description of the economies of scale enjoyed by Verizon and why it is unreasonable for the largest

1		ILEC in the country to suggest that its ordering and provisioning costs exceed
2		those of other similarly situated ILECs by such enormous amounts.
3		
4	Q.	PLEASE DESCRIBE THE GENERAL NATURE BY WHICH THE
5		VERIZON COST MODEL DETERMINES NONRECURRING COSTS.
6		
7	A.	The key to any good NRC model is accurate information on times required to
8		perform activities. These times result in the various types and magnitudes of
9		costs that ultimately result in rates. Verizon's cost model, however, utilizes a
10		very indirect method for determining the minutes per order (see Exhibit SLM-2).
11		The cost model file FL Wholesale Ordering Appendix, worksheet; AMON 1 &
12		2 uses calculations involving the following worksheet columns; Observations,
13		Direct Minutes, Indirect Percent, Total Minutes Activity Volume to calculate
14		Minutes per Order, for the seven work items (Enter Time of Receipt in Log,
15		Reject "Unables" to CLEC, Sort and Staple LSR Pages, Determine LSOG
16		Number, Enter LSR into Tracking System, File Manual LSR for Processing)
17		making up the Manual Order Processing; Manual LSR Receipt.
18		
19	Q.	PLEASE DESCRIBE THE COLUMNS AND ASSOCIATED
20		CALCULATIONS.
21		A. Observations (cell G6) are indicated as variable A (cell G7) and are
22		referenced in Note: 1 as data obtained through Work Sampling study conducted at
23		the NOREC.

The Observations entries are hard-coded into the study without any supporting documentation. This is true for all seven of the Observations entries. The Observations are totaled in cell G18 and then multiplied by the Direct Minutes (cell H6) entry to produce another variable identified as B (cell H7). The operators used to determine B are A (total observations) times 15 (a hard-coded value in the formula for calculation of direct minutes.

Column I6 Indirect Percent is calculated as the total Indirect Time (cell H56) divided by Total Direct Production Time (cell H53), which is a hard-coded value, in this case being 414. This in turn generates a percentage (** **) used to calculate Total Minutes (cell J18).

A hard-coded value for Activity Volume (** ** in this instance) is used as a variable to calculate Minutes per Order (cell L6) by dividing Total Minutes (D) by Activity Volume (E). In this case the value for Minutes per Order is ** **.

The following statement is made in Note 1:

Verizon-Florida, Unbundled Network, Page 3

The cost team conducted Work Sampling studies in the Durham NMC and the San Angelo NOREC in 1999. Work Sampling is a method of work measurement. In this study, the cost managers estimated the proportions of time spent by the Service Representatives on the pre-ordering and ordering activities. These estimates are based on a large number of

1		observations. The underlying assumption is that the proportion of time the
2		activity is observed in the sample will be the proportion of time spent on
3		the activity in general. After the cost team recorded their observations for
4		the Work Sampling study, they worked with SMEs to determine the
5		frequency of the activities for each of the order processing modes.
6		Additionally, SMEs provided time estimates for activities that were not
7		observed during the study. (See Appendix Tab 1 for details of the Work
8		Sampling study.)
9 10		The appendix Tab 1 referred to in parenthesis cannot be located in the
11		documentation supplied by Verizon.
12 13		Exhibit SLM-2 provides a visual reference for the description of the cost study.
14		The model has the horizontal and vertical grid cell reference printed to make the
15		identification of individual cells easier.
16		
17		Exhibit SLM-2 also illustrates the complexities of the calculations necessary to
18		establish Minutes per Order (cell L18) for one process; Manual Order Processing,
19		and Manual LSR Receipt.
20		
21	Q.	MR MORRISON, YOU HAVE REFERRED TO HARD-CODED VALUES
22		SEVERAL TIMES ARE THESE VALUES A PROBLEM?
23	A.	It is not clear whether the values are problematic. But the fact that the values are
24		hard-coded makes it impossible for reviewers to determine their source or

veracity. Hard-coded values make it impossible to audit the calculations or results arrived at by their use. In the case of Verizon's cost studies, the 15 values used in calculating direct minutes, total minutes and minutes per order cannot be audited or verified.

While all studies have some hard-coded information, Verizon's studies fail to provide any references or cites for that information. The Commission should require Verizon to provide such references if formulas or other references are not provided.

Q. DO YOU HAVE ANY OTHER CONCERNS RESPECTING THE

VERIZON NRC METHODOLOGY?

A. Yes. As previously noted, Verizon develops direct minutes for work steps by multiplying the number of observations for each work step times an arbitrary and unsupported ** ** minutes. Verizon then grosses-up those minutes by what it terms an "indirect percent." I have seen instances where Verizon's indirect percentage gross-up factor has been as much as ** **. (See FL Wholesale Ordering Appendix workbook, worksheet AULS-1 & 2, cell J42). Nowhere in the studies did I find any explanations as to why the application of this indirect percentage is appropriate or necessary.

Additionally, for both manual and semi-mechanized orders which I describe below, Verizon applies a flow-through percentage of ** **. Though I have

not taken issue with this percentage in this testimony, I have serious concerns given that its use in not explained in the NRC studies. Moreover, the ** ** figure is not supported by any data or forecasts in the studies. On its face, ** flow-through is indicative of a very inefficient process. I however, a would recommend flow through figures far closer to 95% - 98% as those are definitely achievable figures that Verizon should be striving toward in an effort to reduce its own costs. Indeed, in a forward-looking study, these are the efficiency levels that must be assumed, regardless of Verizon's current level of efficiency.

9

10

11

12

13

14

1

2

3

4

5

6

7

8

DID YOU ADJUST THE FLOW-THROUGH RATE? Q.

No. While I recognized that Verizon's application of 40 percent flow-through A. rates was improper for a TELRIC study, this percentage was applied as an intermediate step. Rather than attempting to change the flow-through rate, I made changes to the number of observed activities such that the eventual work times for a particular task were in line with what I have witnessed or encountered in my 15 experience. The change in observations was used as a proxy for changing the 16 17 flow-through rate. The resulting rates reflect my experience with efficient, 18 forward-looking applications and technology.

19

20 PLEASE PROVIDE A LISTING OF THE NRC RATE ELEMENTS YOU Q. 21 HAVE REVIEWED IN THE VERIZON NRC MODEL.

22 I have reviewed the following six (6) NRC rate elements: A.

1		ORDERING
2		Unbundled Loop
3		Exchange - Basic - Initial (100% Manual and Semi-Mechanized Ordering)
4		Unbundled Port
5		Exchange - Basic - Initial (100% Manual and Semi-Mechanized Ordering)
6		
7		Enhanced Extended Links (EELs) – Loop Portion
8		DS1 / DS3 - Initial (100% Manual and Semi-Mechanized Ordering)
9		
10		SERVICE CONNECTION
11		Unbundled Loop
12		Exchange - Basic - Initial (Initial and Additional Unit)
13		Unbundled Port
14		Exchange - Basic - Initial (Initial and Additional Unit)
15		
16		Enhanced Extended Links (EELs) - Loop Portion
17		DS1 / DS3 – Initial (Initial Unit)
18		I provided a comparison of Verizon's proposed rates with my proposed rates
19		earlier in this testimony. The rates I have reviewed and corrected are in two
20		categories: Ordering and Service Connection.
21		
22	Q.	PLEASE DESCRIBE THE TYPES OF NRCS PROPOSED BY VERIZON
23		FOR ORDERING.
24	A.	Verizon proposes two different types of ordering charges. The first type is called
25		"100% Manual" and assumes that the receipt of an order is accomplished via fax

machine and is processed manually. The second type is called "Semi-Mechanized" and assumes that many of the work steps involved are in some sense automated, however Verizon does not indicate which tasks are automated and which tasks are performed manually.

18

19

20

21

A.

1

2

3

4

Q. DOES VERIZON PROPOSE AN ORDERING TYPE THAT IS 100

PERCENT MECHANIZED?

Apparently not. In the testimony of Messrs. Steele and Richter, no such order type is presented nor does Verizon's cost study appear to acknowledge the possibility that an order could be processed without human intervention. This is an oversight that the Florida Public Service Commission should remedy. While Dr. Ankum discusses in detail the need to assume efficient, forward-looking practices when developing TELRIC costs, the Commission should also be aware that telecommunications carriers (both ILECs and CLECs) are aggressively pursuing efforts to mechanize as much of the ordering and provisioning process as possible. For example, the largest CLECs have spent millions of dollars building Electronic Data Interchange (EDI) systems so that they can interact with ILECs across the country in a mechanized environment. The CLECs have made this significant investment to reduce transaction costs and to reduce errors that ultimately result in poor quality of service. Verizon's studies largely ignore these cost-saving efforts in assuming that the majority of ordering and provisioning activities will be accomplished manually by Verizon personnel.

23

Q. ARE YOU RECOMMENDING THAT VERIZON DO AWAY WITH THE

100% MANUAL FORM OF ORDERING?

Not necessarily. There may be some ALECs that wish to provide local service 3 A. requests (LSRs) and access service requests (ASRs) to Verizon on a manual basis 4 5 using fax machines or other manual means. Should Verizon receive orders in 6 such a fashion they should be permitted to recover reasonable costs; however, the processes that Verizon must go through after receipt of a manual order should be 7 8 as efficient as possible. In a sense, and with an eye toward a forward-looking 9 order processing system, the processes Verizon implements after receipt of a 10 manual order should approach what it terms a semi-mechanized order processing 11 arrangement. Moreover, the processes that Verizon puts in place when it receives 12 a semi-mechanized order should approach what would be considered a 100 13 percent mechanized order process.

14

1

2

UNBUNDLED LOOP NRCs

16 17

15

Q. WHAT ARE VERIZON'S PROPOSED CHARGES FOR THE FIRST

18 UNBUNDLED LOOP?

- 19 A. Verizon proposes a charge of \$56.07 to order the first unbundled loop on a LSR.
- This proposed charge is comprised of five components: [1] Establishing a New
- Order; [2] Establishing a Disconnect Order; [3] Preordering; [4] Record Order;
- and [5] NMC Shared / Fixed Costs. The Verizon NRC study also includes place-

1		holders for OSS transaction costs to be applied; those costs, however, are not
2		included in this study.
3		
4	Q.	PLEASE DESCRIBE EACH OF THESE FIVE COMPONENTS.
5	A.	What Verizon terms as a "New Order" actually refers to the manual receipt,
6		manual entry, manual editing, order processing and off-line processing stages of
7		order delivery. This component accounts for ** ** of the entire \$56.07
8		NRC for ordering an initial loop on a 100% manual basis.
9		
10	Q.	PLEASE DESCRIBE THE "MANUAL RECEIPT" COMPONENT OF
11		THIS COST CATEGORY.
12	A.	Verizon's "manual receipt of an order" includes a large amount of time dedicated
13		to entering an ALEC's LSR into a tracking system. In the second step for manual
14		entry, the LSR is reviewed and entered into the Verizon secure integrated gateway
15		system (SIGS).
16		
17	Q.	WOULD YOU EXPECT THE TRACKING MECHANISM TO BE
18		INITIATED WITH THE ENTRY OF AN ORDER?
19	A.	Yes. In a forward-looking system the entry of the order should automatically
20		populate the tracking system. However, Verizon assumes that a Verizon
21		employee will need to enter the LSR data first into the tracking system, and then
22		enter the same LSR information into the actual ordering interface. This isn't
23		efficient and is exactly the type of duplication that would be eradicated from the

system by any reasonable process engineer. The observations and times associated with entry of the LSR into a tracking system are redundant and unnecessary.

4

5

6

7

8

9

10

11

12

13

14

15

16

17

18

19

1

2

3

O. PLEASE CONTINUE.

The third step references manual edits performed on the LSR. The work steps A. listed by Verizon include verification steps once any edits have occurred. These edits appear to occur in Verizon's SIGS system and hence the multiple verifications may not be necessary. The fourth step involves order processing. This is determined by calculating the number of minutes for order entry processing. In this calculation Verizon applies an unsupported efficiency factor of ** ** and an unsupported flow through factor of ** **. These algorithms are used by Verizon to convert a number of observations into a certain number of minutes per order resulting in approximately **12** minutes to enter the new LSR into the SIGS system and ** ** minutes to enter a disconnect order into the SIGS system. Other than the number of observations and a notation in the studies that references work sampling and studies performed, there is no further support for the actual work times required.

20

21

22

23

The fifth step for the "New Order" activity is to determine costs associated with off-line processing. This includes activities such as faxing error reports, working with directory listings, and a host of unsubstantiated activities such as "Late Order

Report", "State Projects", and "Miscellaneous Disconnects". Verizon provides no indication of what these work activities are intended to do and in no way supports either the need for these activities or the amount of time assigned to them.

4

5 Q. PLEASE DESCRIBE THE SECOND COMPONENT OF UNBUNDLED 6 LOOP NRCS -- [2] ESTABLISHING A DISCONNECT ORDER.

7 For the disconnect component, Verizon identifies work steps and calculates work A. 8 times for manual receipt, manual entry, manual editing, order processing and off-9 line processing, just as it did for the "New Order" component of the 100% manual 10 NRC for an initial loop. Many of the same problems exist. Moreover, while 11 Verizon seeks recovery for disconnection in this component of the NRC, it has 12 ' previously included disconnect costs in the "New" component. This component ** of the \$56.07 for ordering an initial loop on a 100% accounts for ** 13 14 manual basis.

15

16

17

18

19

20

21

22

A.

Q. PLEASE DESCRIBE THE THIRD COMPONENT OF AN UNBUNDLED LOOP NRC -- [3] PREORDERING

The preordering component of the Verizon NRC study accounts for ** ** of the entire NRC for ordering an initial loop on a 100% manual basis. In auditing the NRC study to determine the origin of the ** **, the basis boils downs to 54 observations of preordering. No description of the work activities for preordering is provided whatsoever.

1 Q. PLEASE DESCRIBE THE FOURTH COMPONENT OF AN UNBUNDLED

2 LOOP NRC -- [4] RECORD ORDER.

In auditing the Record Order component, which adds ** ** to the entire A. NRC for ordering an initial loop on a 100% manual basis, it was discovered that the NRC model loops back to work times that were already included in the New component. Further, in order to make this determination, the NRC model has links to at least six (6) different workbooks and/or worksheets. While this component is not the most significant in dollar terms, it is duplicative of components already accounted for in other stages of cost development.

Q. PLEASE DESCRIBE THE FIFTH COMPONENT OF THE UNBUNDLED

LOOP NRC -- [5] NMC SHARED/FIXED COSTS.

A. In its NRC study, Verizon proposes a rate additive of ** ** for each order to cover the costs of its National Open Market Centers (NMC) where these orders are processed. In determining this cost, Verizon has estimated costs for three centers (Idaho, North Carolina and Indiana) and then divides those costs by the number of orders it expects to process each year (totaling nearly ** ** million in costs to be recovered). Even a cursory review of the NMC information suggests that Verizon has included a myriad of anticipated costs that are overstated or simply unreasonable. For example, a portion of the ** ** million price tag consists of nearly ** ** for recruiting personnel and over ** ** for anticipated employee relocations.

1	Q	DO YOU HAVE ANY OTHER CONCERNS ABOUT THE COST OF THE
2		NMC?
3	Α	Yes, not only is the NMC shared and fixed costs of \$18,498 million that Verizon -
4		FL seeks to recover from each ALEC LSR inappropriate, the total cost is
5		overstated by the NRC proposed by Mr. Steele.
6		
7		Mr. Ankum's testimony discusses the appropriate cost of capital and
8		depreciation lives that should be used in Verizon's cost models. Verizon's
9		NMC annual shared and fixed costs are overstated because they are
10		determined using a **
11		where the NMCs are located (see Verizon NRC model, FL Wholesale Ordering
12		Appendix.xls, sheet ACCF). While not disclosed in the NRC capital cost factor
13		assumptions, it is highly probable that Verizon is also using its financial reporting
14		lives for the depreciation component of this factor. Combined, the level of these
15		two components significantly overstates the NMC shared and fixed costs. If the
16		Commission denies the ALEC Coalition recommendation to reject recovery of
17		NMC expenses, than it should require Verizon to adjust these costs for
18		appropriate cost of capital and depreciation assumptions.
19		
20	Q.	WHAT IS YOUR RECOMMENDATION WITH RESPECT TO
21		TREATMENT OF THE NMC COSTS?
22	A.	The NMC costs should be rejected. These are embedded rather than forward-
23		looking costs as described in more detail by Dr. Ankum. Further, there is no

reason that service order processing centers need to be dedicated solely to processing ALEC orders. Indeed doing so would likely make the process less efficient as opposed to more efficient. Order and provisioning service (regardless of who the customer is) is a process whose costs are driven substantially by economies of scale and scope. Building, staffing and operating two distinct operation centers so that Verizon can handle its retail business with one system and its CLEC orders with another is not only discriminatory, it undoubtedly results in higher costs than would be incurred by a more efficient, integrated system. The existing Verizon order processing centers should be able to handle ALEC orders with a minimum of personnel training and additional costs for center build-out, furnishing, staffing, etc. (i.e., it is generally easier to expand existing operations handling similar functions than it is to build a new, stand alone system). In my recalculations, I set the NMC additive to \$0.00 as these costs are not appropriate.

Q. WHAT ALTERNATIVE RECOMMENDATIONS DO YOU HAVE FOR THE NMC COST?

A.

If the Commission finds that some of the NMC implementation cost cannot be rejected. My alternative recommendation would be for the Commission to expand the base of rate payers as California Public Utilities Commission did in its Decision 01-09-063 September 20, 2001 ruling. This will lower the impact on any one group of ratepayers. In the California proceeding, the Californian PUC

Settlement Agreement provides that the amount of \$12.0 million will be recovered over two-years, recovery will be by a surcharge calculated using the billing base approved in Verizon's Annual Price Cap filing for that year. The surcharge percentage, as calculated, shall be applied to Verizon's bills for toll, exchange, and access services. Spreading the recovery over all three major groups of services in (i.e., local, toll, and access) is reasonable. The larger the billing base, the smaller the per-customer surcharge, with less effect on individual customers.

CORRECTED NRCS

Q. EARLIER IN YOUR TESTIMONY YOU DESCRIBED CORRECTED

NRC RATES THAT SHOULD BE ADOPTED INSTEAD OF THOSE

ADVANCED BY VERIZON. PLEASE EXPLAIN HOW YOU ARRIVED

AT THOSE ALTERNATIVE RATES.

A. The processes by which I recalculated Verizon's NRC charges can only be properly explained by explaining the process required to analyze the Verizon model generally.

The Verizon models provided on CD-ROM were transmitted with a read-only attribute. In order to save any changes made to the Verizon models I had to copy the files from the CD-ROM to the hard disk of my computer. I then removed the read-only attribute so I could save my changes. I also had to update the links to each and every Excel workbook used by the Verizon models. Once this was

1		accomplished I was able to audit Verizon's development of various NRCs make
2		appropriate changes. Those changes are documented below.
3		
4	Q.	BEFORE YOU DESCRIBE THE CHANGES YOU MADE TO THE
5		VERIZON NRC MODELS, IS THERE ANY INFORMATION YOU NEED
6		TO PRESENT THAT IS RELEVANT TO YOUR CHANGES?
7	A.	Yes, there is. Verizon has developed work times for various tasks by determining
8		a number of observations of different work activities and then applying a certain
9		number of minutes to those observations. This is disconcerting since not all work
10		step observations take the same amount of time. Not only is Verizon's method
11		cumbersome and prone to substantial inaccuracies, its only function appears to be
12		to make analyzing the studies more difficult. For example, in order to correct the
13		work times, I was required to adjust the number of observations in order to alter
14		existing work times. This is terribly inefficient and not the intuitive way to adjust
15		studies.
16		
17	Q.	PLEASE DESCRIBE THE CHANGES YOU MADE TO THE
18		UNBUNDLED LOOP NRC FOR AN EXCHANGE-BASIC-INITIAL LOOP
19		ORDERED ON A 100% MANUAL BASIS.
20	A.	I reset the number of observations for entering the LSR into the tracking system
21		from ** ** to 0 as this task should be done during the order entry process for
22		OSS as opposed to two steps. First the manual process of two entries creates a
23		situation where input errors can cause data mismatches between systems and lost

1 orders that require additional steps to resolve. Secondly, the entire data mismatch 2 issue can be resolved with edits in the front end of the OSS order entry process to 3 eliminate or minimize costly errors. The OSS can also be updated with the capability of tracking all activity submitted to the system as opposed to having 4 two systems. In both Malaysia and Switzerland, I developed telecommunications 5 6 provisioning systems. We had a one-time entry process for all service requests; 7 two steps were not required. If Verizon has not developed such an efficient 8 system, then its processes are inefficient and the resulting costs should be 9 excluded in the development of TELRIC rates. 10 11 I also changed the number of observations of the order entry into SIGS from ** ** entries to 100 entries. 12 WHY DID YOU REDUCE THE NUMBER OF OBSERVATIONS BY THIS 13 Q. 14 **AMOUNT?** 15 A. By reducing the order entry observations I brought the order entry time down 16 from ** ** to about 6 minutes. This time is more reasonable in that 17 OSS is typically designed to avoid or minimize manual entries. In my experience 18 with the implementation of OSS 6 minutes is a more reasonable time than Verizon's original time of ** 19 20 21 Q. PLEASE CONTINUE WITH YOUR CORRECTIONS. 22 I set the number of observations for verification of changes from ** ** to 0 Α.

because the electronic system should be able to handle verification activities. The

systems I developed always incorporated verification activities. I also set the number of observations for verification of final steps in SIGS from ** ** to zero. These steps should not be required in a forward-looking system.. By forward-looking I am not suggesting that this technology is not currently available. Systems are available today to handle these verifications.

I set the number of observations for reviewing the LSR from ** ** to 5. Once again the observations were reduced to arrive at work times I deemed appropriate as described above. "Review of the LSR" is included in every step. I consider this number of LSR reviews to be excessive because this type of activity can be designed into support systems to eliminate this type of redundancy. I would be extremely surprised if Verizon's retail service order process is so heavily reviewed by Verizon personnel after the information has been placed in the electronic ordering system. Again, this is exactly the type of duplication that any process engineer would strive to remove from a system when evaluating efficiency and cost savings.

I set the number of observations for order processing for order entry from

** ** to 60. This has the effect of providing for 15 minutes of order entry

time. I believe this is more than generous based on my experience. The systems

should be designed to expedite order entry. Screen formatting, automatic editing,

and prompts make this process much more efficient than assumed by Verizon.

I set the number of observations for directory listing inquiries for resale LMS

corrections from ** ** to 0 because there was no explanation of this activity.

From the cost study description, these items appear to be directory sales items and should not be performed at the expense of the ALECs. All directory activity should pay for itself since this is a profit center for ILECs. Given the complete lack of information on this activity, however, it is not clear how the numbers were generated.

I set the directory listing quality check revisions and correction observations from

** ** and ** ** respectively to 0 in both instances as accuracy would be

accomplished and expected by a properly designed electronic ordering system in a

forward-looking process.

I set the number of observations of service activation reports from ** ** to 0.

I set the late order reports from ** ** to 0. I set the state projects observations from ** ** to 0. I set the miscellaneous disconnects from ** ** to 0. All of these observations were set to zero because no explanations were provided as to why these activities were appropriate and, given my experience, I could not comprehend why they would be necessary. These items appear to be reports without a purpose or benefit to the processing of the ALEC service request.

Systems should provide fall-out reports on an exception basis. This minimizes

the number of reports and the need to respond to reports. Time is eliminated keeping track of and resolving report issues.

For disconnects order entry into SIGS, I changed the number of observations from

** ** to 10. I did so because customer information is generated during the

connect process and the disconnect process generates a disconnect record with

minimum input. The input requirements are those that identify the circuit for

removal from service with the appropriate status changes in systems and the

removal of equipment from service.

For manual LSR editing, I set the number of observations for reviewing the LSR from ** ** to 0. I considered this to be redundant work given the other order entry activity. The review would actually be part of the entry in that the technician inputting the order should monitor their own input to avoid errors in the beginning of the process rather than adding steps down stream to validate previous work.

For disconnect order processing I set the number of observations for disconnect order entry from ** ** to 5. I changed this value due to the fact that disconnect order entry should be a simpler overall process, only indicating to business systems that the service is be removed. The system generates the necessary response or the manual process alters existing records as to the status change, whether it is system information or manual information.

For preordering I changed the number of observations from ** ** to 0. No 2 3 explanation of the actual work activities or a description of why these activities 4 are necessary was given and I can think of no need for such extensive preordering 5 activity. I recommend that task items which are not well defined as to their 6 purpose, and have insufficient explanation as to what work is being performed 7 and why, be eliminated from the cost study. 8 9 10 Respecting recording the order, I reduced the number of observations from ** ** to 0. That has the effect of reducing the minutes spent recording each 11 order from ** ** to 0. No supporting information was presented for this 12 13 process and again, an electronic ordering system should provide whatever reports 14 or recording are needed with or without manual intervention. 15 16 Q. WHAT IMPACT DID THE CORRECTIONS YOU DESCRIBE ABOVE 17 HAVE ON THE RATE PROPOSED BY VERIZON FOR ORDERING A 18 **UNE LOOP ON A 100% MANUAL BASIS?** 19 Verizon has proposed a charge of ** ** for this activity. By making the A. 20 changes I describe to the Verizon models, those models generate a more

1

21

22

appropriate rate of \$29.81.

1	Q.	WHAT CHANGES DID YOU MAKE FOR THE SEMI-MECHANIZED
2		ORDERING PROCESS FOR AN UNBUNDLED LOOP?
3	A.	For this element Verizon proposes a charge of ** ** to order the first
4		unbundled loop on an LSR. This proposed charge is comprised of the same five
5		components as the 100% manual process: [1] Establishing a New Order; [2]
6		Establishing a Disconnect Order; [3] Preordering; [4] Record Order; and [5] NMC
7		Shared / Fixed Costs. The only exception is that there are no costs associated
8		with item 4, record order. Two precise similarities exist, those being item 3
9		(preordering) and item 5 (NMC Shared / Fixed Costs).
10		
l 1		The changes made for ordering a loop on a 100% manual basis generally flowed
12		through the models to the semi mechanized portions of the Verizon NRC study.
13		Those changes resulted in a semi mechanized NRC cost of \$19.23, down from
14		Verizon's proposal of ** .**
15		
16	Q.	PLEASE LIST AND DESCRIBE THE CHANGES YOU MADE TO THE
17		VERIZON NRC STUDIES FOR THE INITIAL UNIT OF A SERVICE
18		CONNECTION FOR AN UNBUNDLED LOOP?
19	A.	I changed the time for facilities assignment from ** ** minutes to 3 minutes for
20		the New component of the provisioning activities. I further changed the time for
21		facilities assignment for disconnect from ** ** minutes to 3 minutes. In my
22		experience these times are more than adequate in an automated assignment
23		environment. Facilities assignment is a mechanized process for the ILECs. The

process of assigning a facility involves making an entry into a mechanized system to determine the availability of facilities and assigning the facility to the customer's circuit identifier. Facilities assignment is one of the most repetitious tasks in an assignment center and technicians become very skilled in the task. In my experience with systems, facility assignment should rarely take more than 3 minutes.

Respecting central office for provisioning a new unbundled loop, I changed the average drive time from ** ** minutes to zero. I believe these disconnects should be part of a dedicated inside plant (DIP) program. Existing cross connections can be left up and reused for the next inbound service utilizing the same facility. This would be a much more efficient process. OSSs for facility assignment support this program and can handle this type of cross connect activity on a flow-through basis.

I changed the time to run jumpers from ** ** minutes to 2.0 minutes. The forward-looking network would use an efficient common systems main interconnect (COSMIC) type main distribution frame (MDF). This is a generous time for running jumpers on COSMIC MDF configurations supported by OSSs. On a COSMIC MDF, jumpers are designed to minimize length. The COSMIC frame is a single sided frame, so the technician never needs to run a cross connect from one side of the frame to the other. So the technician goes to the first identified termination point, and uses a punch-on tool to quick connect the

jumper. He then lays the jumper into the shelf as he walks to the next termination point. He adds proper slack to the jumper and terminates the jumper at the second termination point. This is normally done in about 12 feet of space. An experienced technician can do these jumpers very quickly.

For disconnection I set the numbers to 0 minutes, considering that these jumpers fall into the DIP program mentioned above. These circuits should be left up so no additional cross connects are required should the circuit be reassigned. This type of process eliminates all central office work on this type of circuit.

For the fieldwork portion of the calculation for installation of a basic unbundled loop, Verizon's NRC study links back to a total number of minutes for the fieldwork portion of the service connection. Though Verizon shows **

**
minutes of work for a basic new unbundled loop, its study links to the number of minutes derived for a complex digital loop of **

** minutes. Although this appears to be an error in the Verizon studies, in my experience it is unlikely that a field technician could spend **

** minutes, or **

**
minutes installing a service in the field. The technician must place a cross connect at the facility distribution interface (FDI) and establish that continuity exists to the customer premise. In my experience these activities, including average drive time and the actual work time, should not exceed 40 minutes per initial circuit.

	-	
2		UNBUNDLED LOOPS?
3	A.	I made the same changes for facilities assignment and central office work that I
4		did for the Initial unit. For fieldwork for an additional line Verizon makes the
5		same linking mistake. Nevertheless I changed the number of minutes for each
6		additional circuit in the field from ** * * minutes to 10 minutes. The
7		technician is adding an additional line while installing the original line, in other
8		words he is repeating the task he performed to install the initial line while at the
9		same location as the initial line. Thus, the additional line is more efficient than
10		the initial line, making ten minutes a reasonable time for this task.
l 1	Q.	WHAT WERE THE EFFECTS OF YOUR CHANGES ON VERIZON'S
12		SERVICE CONNECTION COST FOR AN INITIAL AND ADDITIONAL
13		UNIT FOR A BASIC UNBUNDLED LOOP?
14	A.	The service connection cost for the initial loop went from **
15		The service connection cost for each additional loop went from ** ** to
16		\$9.24.
17		
18 19	UNB	UNDLED PORTS
20	Q.	PLEASE DESCRIBE YOUR OBSERVATIONS ABOUT THE 100%
21		MANUAL AND SEMI-MECHANIZED INITIAL ORDERING CHARGES
22		FOR UNBUNDLED PORTS AND ANY CHANGES YOU HAVE MADE TO
23		THE VERIZON NRC STUDY TO CORRECT PROBLEMS IDENTIFIED?

DESCRIBE THE CHANGES YOU MADE FOR ADDITIONAL BASIC

1

Q.

1	A.	For these charges Verizon proposes ** ** for the 100% manual order and
2		** for the semi-mechanized order. The components of these charges are
3		essentially the same as they were for the unbundled loop. Those components
4		include [1] Establishing a New Order; [2] Establishing a Disconnect Order; [3]
5		Preordering; [4] Record Order; and [5] NMC Shared / Fixed Costs. The Verizon
6		NRC study also includes place-holders for OSS transaction costs to be applied;
7		those costs, however, are not included in this study.
8		
9	Q.	DID ANY OF THE CHANGES YOU MADE TO THE UNBUNDLED LOOP
10		STUDY FLOW THROUGH TO THE UNBUNDLED PORT STUDY?
11	A.	Yes, several changes described for the unbundled loop flowed through to the
12		unbundled port calculations. Those include changes for the manual LSR entry,
13		order editing and off-line processing. Further, these changes flowed through for
14		both 100% manual and semi-mechanized orders.
15		
16	Q.	WHAT CHANGES DID YOU MAKE THAT DID NOT FLOW THROUGH
17		FROM YOUR MODIFICATIONS TO THE UNBUNDLED LOOP NRC
18		STUDIES?
19	A.	For order processing I changed the Verizon work time estimate of ** **
20		minutes to 10 minutes. This Verizon work time estimate was a hard coded
21		number and was not developed in the Verizon NRC study using the same
22		observation method previously used to develop other work times. Ordering a port

1		differs substantially from ordering a loop in that there are fewer systems that must
2		be accessed.
3		
4		For disconnect order processing for the unbundled port I changed Verizon's work
5		time estimate from ** ** to 5 minutes for the same reason noted above.
6		
7	Q.	FOR THE UNBUNDLED PORT DID VERIZON PROPOSE THE SAME
8		NMC RATE ADDITIVE AS IT DID FOR THE UNBUNDLED LOOP AND
9		IF SO HOW HAVE YOU TREATED THAT ADDITIVE?
10	A.	Yes, it did. As I did for the unbundled loop ordering NRC, I set the Verizon
11		NMC additive to zero for the same reasons noted earlier in this testimony. I have
12		done so for both the 100% manual and the semi-mechanized ordering types.
13		
14	Q.	PLEASE DESCRIBE THE RESULTS OF YOUR MODIFICATIONS.
15	A.	As previously noted, Verizon proposed a charge of ** ** to order an
16		unbundled port on a 100% manual basis. After making the modifications I
17		describe above, I recalculated a rate of \$21.24. For the semi-mechanized order of
18		an unbundled port Verizon calculates a NRC of ** **. Based on the
19		changes I have made to the Verizon studies I develop a charge of \$10.66.
20		
21	Q.	WHAT RATES HAS VERIZON PROPOSED FOR SERVICE
22		CONNECTIONS FOR AN UNBUNDLED PORT?

i	A.	For the first unit verizon proposes ** . For each additional unit a charge
2		of ** ** is proposed.
3		
4	Q.	PLEASE DESCRIBE THE CHANGES YOU MADE TO THE
5		UNBUNDLED PORT NRC STUDY FOR THE SERVICE CONNECTION
6		CHARGES FOR THE INITIAL AND ADDITIONAL UNITS, EXCHANGE-
7		BASIC-INITIAL PORTS ORDERED ON A 100% MANUAL BASIS.
8	A.	The first change I made was to modify the times presented by Verizon for
9		provisioning (i.e. facility assignment) the unbundled port. I made modifications
10		in four areas: [1] new service installation for the initial port; [2] disconnection of
11		service for the initial port; [3] new service installation for the initial port; and [4]
12		disconnection of service for the initial port.
13		
14	Q.	PLEASE, DESCRIBE THE CHANGES YOU MADE TO THESE FOUR
15		ACTIVITIES.
16	A.	For the new service installation times I changed the Verizon estimate of
17		** ** minutes to 5 minutes for the initial service connection. I changed the
18		estimate for the additional service connection from ** ** minutes to 2
19		minutes. I made these changes to reflect the following work steps for facility
20		assignment for an unbundled port. First the technician would make an entry into
21		a switch inventory and provisioning system to establish the circuit and facilities
22		that make up the ALEC connection. The flow-through from the provisioning and
23		inventory system establishes any switch data build or translations required to

1		establish the switch-based service. For additional unbundled ports, the inputs
2		would be the same; however, there would be some timesavings in that the
3		technician would only be required to gain access to the various facility assignment
4		systems once.
5		
6		I also made the same changes for the disconnection times used to develop the
7		unbundled port NRCs for exactly the same reasons stated above.
8		
9	Q.	WHAT IMPACT DID THE CHANGES YOU DESCRIBE ABOVE HAVE
10		ON THE RATES PROPOSED BY VERIZON FOR SERVICE
11		CONNECTION NRCS FOR UNBUNDLED PORTS.
12	A.	As previously noted, for the first unit Verizon proposes an NRC of ** **.
13		After making my modifications this NRC is calculated at \$8.83. For each
14		additional unit a charge of ** ** was proposed by Verizon and I have
15		calculated a charge of \$4.49.
16		
17 18	ENI	HANCED EXTENDED LINKS
19	Q.	HAVE YOU REVIEWED THE VERIZON NRC STUDIES FOR THE
20		LOOP PORTION OF ENHANCED EXTENDED LINKS (EELS)?
21	A.	Yes, I have reviewed the NRCs for the service connection and ordering cost for
22		an initial DS1/DS3 EEL.
23		

1	Q.	WHAT CHANGES DID YOU MAKE TO THE VERIZON NRC STUDY
2		FOR ORDERING A DS1/DS3 EEL ON A 100% MANUAL BASIS?
3	A.	I changed the work time for manual faxing from ** ** minutes to 5 minutes.
4		I further changed the work time to FAX a firm order of confirmation from ** **
5		minutes to 3 minutes. Operating a modern fax machine to send even a large
6		volume of paper is a relatively simple task considering the technology available
7		today. Therefore, 5 minutes and 3 minutes respectively are adequate for two fax
8		transmissions. I changed the time to enter a new order from ** ** minutes to
9		15 minutes. New order entry utilizing reasonably well-designed systems and
10		business processes in my experiences do not take this amount of time. Verizon
11		proposes ** ** minutes for error correction. I believe this is an unnecessary
12		step. The order should have been reviewed as a part of the Production Order
13		Entry with system edits doing the error correction task.
14		
15		I set the number of minutes for escalations and quality checks from ** **
16		and ** ** respectively to 0 in both instances. These business processes are
17		an indication of failure on the part of the ILEC. These failures typically are
18		records synchronization issues on a system-to-system basis or a mismatch
19		between systems status and the actual status of the physical equipment and should
20		not be paid for by the ALEC.
21		
22		For the disconnect portion of this ordering charge I changed the time required to
23		enter a disconnect order from ** ** minutes to 10 minutes. I made these

changes given that the Verizon study relied on unexplained time index calculations that also relied on productive minutes. The productive minutes were hard coded and no support was provided for this input, which was important to the calculations. As I have previously stated, disconnect order entry is a relatively simple task and involves little in building data bases or records entries, but is the process of removing existing service information from records which is by its nature a much less time intensive activity. Therefore, I believe 10 minutes is a reasonable time for disconnect entry.

For the reason noted above for the new service order, I set both the error correction and quality check work times to zero from ** ** minutes and ** ** minutes respectively. Order entry tasks should be performed accurately with the first effort. Expensive follow-up tasks that are designed to ensure accuracy at a later point in the business process are inherently inefficient, and quality work should replace checks points in an efficient business process.

For the record order function I set the minutes for manual receipt of an order from

** ** minutes to 2 minutes. For order processing under the record order function

I set the number of minutes from ** ** minutes to 20 minutes for the 100%

manual order. Records orders are one of the simpler orders to process, they

require no actual work on the service delivered to the customer, but are designed

to correct records issues relative to customer service. I further set the number of

minutes from ** ** minutes to 10 minutes for the semi-mechanized order

1		process. The semi-mechanized order process should be utilizing efficiencies
2		gained from OSS that are designed to speed up tasks such as order processing.
3		
4	Q.	HOW DID THE CHANGES YOU DESCRIBED ABOVE IMPACT THE
5		COST PREPOSED BY VERIZON FOR ORDERING A DS1/DS3 EEL?
6	A.	Verizon has proposed an ordering charge of **
7		manual basis. Given my changes I calculated a more appropriate order charge of
8		\$45.01. Further, Verizon proposed a semi-mechanized ordering charge of
9		** whereas based on my changes to the Verizon study I derive a charge
10		of \$30.93.
11		
12	Q.	PLEASE DESCRIBE THE CHANGES YOU FOUND NECESSARY FOR
13		THE SERVICE CONNECTION FOR AN INITIAL DS1 EEL?
14	A.	The first change I made was to change the service order entry time from
15		** ** minutes to 10 minutes. I changed the facilities assignment for Hi-Cap
16		prework from ** ** minutes to 15 minutes. I further changed the local loop
17		assignment time from ** ** minutes to 10 minutes per occurrence.
18		
19	Q.	PLEASE EXPLAIN WHY YOU REDUCED THESE INPUTS.
20	A.	For the design group activities it must be recognized that, in essence, this is really
21		not a designed circuit. Forward looking OSS support digital loop assignment and
22		provisioning of loops for digital service. These forward-looking OSS improves
23		efficiencies for order entries having qualified facilities inventoried and identified

as available for digital services, to increase provisioning efficiencies. For these same reasons, I have reduced the design group time from ** ** minutes to 10 minutes. I changed the Verizon estimate for testing from ** ** minutes to 15 minutes.

A.

Q. WHY DID YOU REDUCE THE TESTING TIME BY ABOUT 80%?

Modern test equipment is efficient and effective. The industry has designed an array of test equipment designed to meet the requirements of both ILECs and ALECs for testing both digital and analog circuits. A wide selection of multipurpose test equipment is available to expedite testing. Because of the widespread availability and use of such equipment, I have lowered the testing time for EELs to 15 minutes.

For the central office portion of a service connection for a DS1 EEL, Verizon shows ** ** hours of work. In my experience, establishing a DS1 service in the central office involves two to three cross connects. One cross connect on the MDF from DSX panel cross connect points to the facility, and one or two DSX panel cross connects, and a continuity test. This work can easily be accomplished in an hour. Therefore I changed the Verizon estimate of ** ** hours to one hour.

For the field work portion of a service connection for a DS1 EEL, Verizon suggests that ** ** hours are required. In my experience, the field technician

1 would need to establish high frequency cross connects at the SAI or FDI and then 2 deliver the service to the ALEC at the customer premise. This work should take 3 no longer than 1.5 hours to complete. 4 5 Q. PLEASE DESCRIBE THE CHANGES YOU FOUND NECESSARY FOR 6 THE SERVICE DISCONNECTION PORTION OF THE DS1 EEL 7 SERVICE CONNECTION CHARGE. 8 A. The first change I made was to change the service order entry time from 9 ** minutes to 10 minutes. I changed the facilities assignment for Hi-Cap 10 prework from ** ** minutes to 15 minutes. I further changed the local loop assignment time from ** 11 ** minutes to 10 minutes per occurrence. 12 13 Q. PLEASE EXPLAIN WHY YOU REDUCED THESE INPUTS. 14 A. For the design group activities it must be recognized that, in essence, this is really 15 not a designed circuit. . Forward looking OSS support digital loop assignment 16 and provisioning of loops for digital service. These forward-looking OSS 17 improve efficiencies for order entries by having qualified facilities inventoried 18 and identified as available for digital services. For these same reasons, I have reduced the design group time from ** 19 ** minutes to 10 minutes. I changed 20 the Verizon estimate for testing from ** ** minutes to 15 minutes. 21

WHY DID YOU REDUCE THE TESTING TIME BY ABOUT 80%?

22

Q.

1	A.	Modern test equipment is efficient and effective. The industry has designed an
2		array of test equipment designed to meet the requirements of both ILECs and
3		ALECs for testing both digital and analog circuits. A wide selection of multi-
4		purpose test equipment is available to expedite testing. Because of the
5		widespread availability and use of such equipment, I have lowered the testing
6		time for EELs to 15 minutes
7		
8		For the central office portion of a service connection for a DS1 EEL, Verizon
9		shows ** ** hours of work. In my experience, establishing a DS1 service in
10		the central office involves two to three cross connects. One cross connect on the
11	,	MDF from DSX panel cross connect points to the facility, and one or two DSX
12		panel cross connects, and a continuity test. This work can easily be accomplished
13		in an hour. Therefore I changed the Verizon estimate of ** ** hours to one
14		hour.
15		
16		For the fieldwork portion of a service connection for a DS1 EEL, Verizon
17		suggests that **
18		would need to establish high frequency cross connects at the SAI or FDI and then
19		deliver the service to the ALEC at the customer premise. This work should take
20		no longer than 1.5 hours to complete.
21		
22	Q.	PLEASE DESCRIBE THE CHANGES YOU FOUND NECESSARY FOR
23		THE SERVICE DISCONNECTION PORTION OF THE DS1 EFLNRC.

1 A. The first change I made was to reduce the service order entry time from

** ** minutes to 10 minutes. I changed the local loop assignment from

** ** minutes to zero as the service order entry process for disconnect

automatically performs the local loop and facility assignment disconnect

operations at disconnect.

For a disconnect for the design group, I changed the times from ** **
minutes to 0 given that once again the service order entry should automatically
process this activity. There are no design requirements when a service is
disconnected. The disconnect process, as mentioned previously is one of
reestablishing the availability of circuit elements for reassignment.

For the central office disconnection times I changed Verizon's estimate in excess of ** ** to 30 minutes. Central office disconnects consist of removing a physical and/or logical network element arrangement. This consists of physical connections or network element data build information. By its very nature, removal of these circuits is efficient. A technician identifies the circuit and its components from a disconnect order, which is a record of the original service installation, and removes physical connects or changes data entries in network elements to reflect the new circuit status.

For disconnection of the service by field personnel, Verizon claims that ** **
hours are required. I take issue with this estimate given that the only activity that

1		need occur is the removal of the high frequency cross connects. The time to
2		accomplish this activity, including drive time, should not exceed 40 minutes.
3		
4	Q.	GIVEN THE CHANGES YOU HAVE MADE TO THE VERIZON NRC
5		STUDIES FOR THE SERVICE CONNECTION FOR A DS1 EEL, HOW
6		DID THIS EFFECT THE COSTS?
7	A.	For this activity, Verizon proposed a charge of \$** **. The effects of my
8		changes reduce the rate to \$294.11.
9		
10	Q.	MR. MORRISON, DID YOU PERFORM ANY RECALCULATIONS FOR
11		THE NONRECURRING RATES AND CHARGES PROPOSED BY
12		VERIZON FOR UNE PLATFORMS (UNE-P)?
13	A.	No, I did not. The reason I did not was because I had concerns with certain
14		portions of the rate structure proposed by Verizon. More specifically, if an ALEC
15		were to request a UNE-P migration on an "as is" basis where no specified changes
16		were required, I can think of no reason why any service connection charges would
17		apply. Hence, I did not audit Verizon's development of the service connection
18		charges, because they should be set at zero.
19		
20	Q.	PLEASE SUMMARIZE YOUR TESTIMONY.
21	A.	It is clear from my review that Verizon's NRC model suffers from many fatal
22		flaws. The most egregious flaw is Verizon's failure to utilize simple and direct

1		time and motion studies to support the work times used to derive its cost
2		estimates. This fundamental flaw undermines any reasonable use of the results.
3		
4		Where I have been able to recalculate more reasonable NRCs, the Commission
5		should adopt the recalculated charges. For those NRCs that I have not been able
6		to recalculate, the Commission should take into account the average
7		overstatement inherent in Verizon's studies and reduce all order activity NRCs to
8		50% of Verizon's proposed rates and all provisioning activity NRCs to 33% of
9		Verizon's proposed rates.
10		
11	Q.	DOES THIS CONCLUDE YOUR TESTIMONY?
12	A.	Yes.

Docket No: 990649B-TP Witness: Morrison Exhibit No. (SLM-1) Page 1 of 1

Verizon - Florida Wholesale Non-recurring Study Local Wholesale Elements

Indicates Recalculated Charges
