Carlotta S. Stauffer, Commission Clerk Office of Commission Clerk Florida Public Service Commission 2540 Shumard Oak Blvd. Tallahassee, FL 32399-0850

Re: Docket No. 140135-WS - Application for increase in water and wastewater rates in Pasco County by Labrador Utilities, Inc. Our File No. 30057.216

Dear Ms. Stauffer:

The following are Labrador Utilities, Inc.'s ("Company") responses to the Staff's First Data Request dated November 4, 2014:

Please refer to the Discharge Monitoring Reports (DMR).

1. Part B of the DMRs for both June 2013 and July 2013 reflect a monitoring period of May 1, 2013 to May 31, 2013. Please provide Part B of the DMRs for June 2013 and July 2013. If the DMRs are not available, please explain why.

Response: See attached.

Please refer to the Monthly Operation Reports (MORs).

2. The second page of the January 2012 MOR reflects a monitoring period of December 2011. Please provide the second page of the January 2012 MOR. If the MOR is not available, please explain why.

Response: See attached.

The second page of the April 2012 MOR reflects a monitoring period of March 2012. Please
provide the second page of the April 2012 MOR. If the MOR is not available, please explain
why.

Response: See attached.

4. The first page for the August 2012 MOR was not provided. Please provide the first page for the August 2012 MOR. If the MOR is not available, please explain why.

Response: See attached.

5. The first page for the December 2012 MOR was not provided. Please provide the first page for the December 2012 MOR. If the MOR is not available, please explain why.

Response: See attached.

Please refer to the Inspection Reports.

6. In the response dated August 25, 2011, the Utility referenced the Tank Inspection Report and the flow meter accuracy testing. Documents available from the Department of Environmental Protection show three attachments that were included in this response (all sic) – "GST Inspection 01-27-10.pdf", "Labrador Utilities Well#1.xls" and "Labrador Utilities Well#2.xls". Please provide these attachments.

Response: See attached.

Please refer to Schedule A-3.

7. On schedule A-3, line number 18, under the wastewater column, there is a retirement amount of \$19,777 for the Rotary Drum Screen. It states that it is an estimation using the Handy-Whitman index. Please explain what NARUC account number was used to determine the estimation since the Handy-Whitman index uses only water NARUC accounts and not wastewater NARUC accounts.

Response: The NARUC account number used to determine the retirement estimation was 320 Treatment Plant Equipment. While the index is used for water accounts, the Utility has always used it in the past for w plant using the description of the asset.

Please refer to Additional Pro Forma Plant Information.

8. Labrador noted for the WWTP Odor Control pro forma that it received four sealed bids from qualified utility contractors. Please provide the actual bids from each contractor.

Response: See attached.

9. Labrador noted that it executed a contract for the WWTP Rotary Drum replacement with Environmental Equipment Sales, Inc. Did Labrador solicit multiple bids for this project? If so, please provide the bids that Labrador received for the Rotary Drum replacement. If not, why not?

<u>Response:</u> Labrador did not solicit multiple bids regarding the replacement of the rotary drum screen for the following reasons:

- a. The project cost was estimated to be less than \$75,000 and thus below the threshold for requiring multiple bids in conformance with the Utility's business rules.
- b. The original rotary drum screen model was properly sized to meet the operational needs of the wastewater treatment facility during the high season. The model is still offered by the same manufacturer (with some design improvements) and the unit had provided satisfactory

performance over its service life. Therefore, there was no reason to specify or consider a different model or size of rotary screen.

- c. Replacing the rotary drum screen with a unit different from the existing model and type of unit would have triggered the requirement to submit to FDEP signed and stamped engineering plans supplied by a registered professional engineer showing the proposed modifications to the treatment plant. Additional costs would have be incurred in submitting an application for a construction permit as well as payment of a permit application fee to FDEP.
- d. By coordinating the removal of the old screen and the installation of the new screen in conjunction with the ongoing odor control equipment project, the utility was able to utilize the services of the general contractor on that project and thus avoid incurring mobilization and demobilization costs to replace the drum screen that would otherwise have been incurred.
- e. Additional costs would have been incurred in submitting subsequent documentation to FDEP by the professional engineer identifying that the project was completed in conformance with the construction permit and requesting authorization to place the replacement drum into service.
- f. In comparison, by replacing the existing drum screen with the same model unit and using the same footprint, the cost, time and effort to place the new unit in service was less than it would have been otherwise. The new unit was placed into service in November 2014.
- 10. Labrador noted that it will solicit multiple bids prior to awarding the WTP Ground Storage Tank replacement project. Has Labrador solicited those bids yet? If so, please provide a copy of those bids. If not, when does Labrador anticipate soliciting bids for this project?

Response: The bid process for the replacement WTP Ground Storage Tank is scheduled to be completed in early January 2015. A bid tabulation will be forwarded to staff at that time.

Site	Item	NARUC Account Number	Issue Relevance*	Problem	Solution	Regulatory Mandate (M) or Enhancement (E)	Comments	2013	2014	2015	Total
WWTP	Odor Control Equipment	380.4	С	Odor from the WWTP	The project consists of the engineering design, fabrication, and construction of odor control facilities necessary to minimize the impact of plant odors on the surrounding community.		This is part of a settlement between the Utility and Forest Lake Estates Co-Op. No existing assets are expected to be retired.		\$34,670		\$34,670
WWTP	Headworks Equipment	380.4	С	Headworks equipment needed replacement	The project entails the replacement of an existing rotary screen and associated equipment at the headworks at the WWTP.	M	This project also included the relocation of the electrical disconnect switch and installation of equipment control panel on the catwalk. The original drum screen was retired.		\$2,778		\$2,778
Ground Storage Tank	Ground Storage Tank	330.4	C, R, WQ	The ground storage tank needs replacement	The project includes the replacement of the 34,000 gallon finished water storage tank with corrosion resistant materials that will insure adequate and secure finished water is on hand at all times to meet customer needs.	М	Project to be completed before June 2015. The existing tank and associated equipment will be retired.		\$2,703	\$2,703	\$2,703
WTP	Electric Pump Equip Trans Dist	311	C, R	The WTP high service pumps & controls	Install a four-pump high service pump skid and control panel to allow	М	The original high service pumps, controls and manifold were retired.	\$3,51 2			\$3,512

Site	Item	NARUC Account Number	Issue Relevance*	Problem	Solution	Regulatory Mandate (M) or Enhancement (E)	Comments	2013	2014	2015	Total
				were unreliable, system pressure oscillated continuously, pumps cycled on and off constantly.	system pressure to be maintained evenly and reliably. Coordinate with the power company to modify its service to minimize voltage dips and spikes that were causing pump failures.		Failsafe controls were added to provide an alternate means of maintaining pressure in the event of a control panel failure.				
WTP	Water Treatment Equip	320	C, R	Critical control panel spare parts not included in scope of work under CP#2012056	Purchase and store key spare parts to allow HSP's to return to service in the event control panel is damaged or fails.	М	No assets were retired with this expenditure.	\$7			\$7
WTP	Water Treatment Equip	320	C, R	Chemical feed pump failed.	Replace the chemical feed pump to provide the means to feed chlorine solution in order to disinfect the water supply.	М	Existing chemical feed pump was retired.	\$73			\$73

^{*}For Issue Relevance, please use DM (Deferred Maintenance), S (Safety), C (Compliance), R (Reliability), WQ (Water Quality), or WWQ (Wastewater Quality).

Please feel free to contact me if you have any questions or concerns.

Very truly yours,

MARTIN S. FRIEDMAN

Tank Inspection Report

Utilities Inc Labrador Tank Liquid Engineering Corporation 38368B

Tank Name:

Labrador

City: State: Zephyrhills

Year Built:

Unknown

Florida

Tank Type:

On Grade

Tank Capacity:

34KG

Type of Construction:

Bolted Steel

Inspected By:

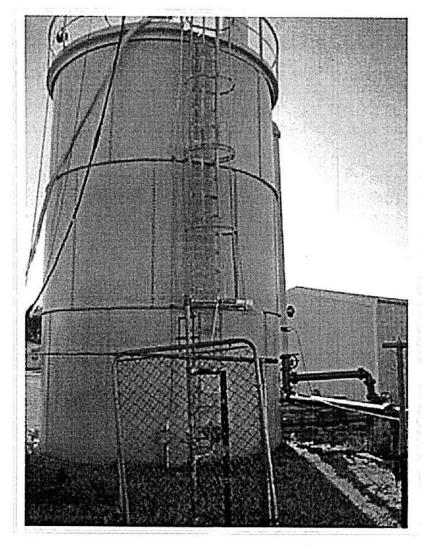

LEC Maintenance Team 10 - Team Leader James Richards

Inspection Date:

January 27, 2010

GENERAL

This report is a supplement to the visual and video inspection undertaken for Utilities Inc by Liquid Engineering Corporation of Billings, MT. The Labrador tank is an on-grade water storage tank. The tank has a 34,000-gallon capacity with an overall height of 28 feet and a diameter of approximately 15 feet. The tank is founded on a concrete base.

Utilities Inc Tank Inspection Report

Labrador Project No. 38368b

STANDARDS

The inspection of this tank was performed by a dive maintenance technician using surface supplied air, totally encapsulated in a sealed dry suit mated to a sealed dry divers hard hat and conducted in accordance with all applicable OSHA, EPA, AWWA, NACE, SSPC and ADC requirements and/or recommendations.

The inspection consisted of a visual observation of the tank's interior and exterior components and coating system. The tank was not drained for the inspection and all interior assessment data was recorded using real time video with live voice narration. Exterior assessment data was documented using digital still photographs.

CONDITION OBSERVATIONS

Conditions noted during the field inspection are documented in the following pages and are supplemented with color photographs at the end of the report. Condition ratings used to describe the inspection findings are annotated as follows:

Excellent:

No deficiencies noted.

Good:

Minor deficiencies noted. Item is functioning as designed.

Fair:

Major deficiencies noted. Item is in need of repairs to continue functioning as designed.

Poor:

Repair or replacement required immediately. Item may no longer function as designed.

CONTAMINATION, HEALTH & SAFETY REPORT

Contamination and Health

- Air Vent(s) and Screen(s) The tank was equipped with a single mushroom shaped air vent. The inspector
 reported the vent to be properly screened.
- Hatches The topside access hatch was properly secured, but did not have an adequate seal.
- Exterior Overflow The exterior overflow was equipped with a flapper and gasket, but did not have a fine
 mesh screen installed.
- Roof to Wall Joint This area appeared to be sealed properly at the time of the inspection.
- Roof Integrity No holes, standing water or cracks were observed on the roof or wall areas.
- Manway Integrity The manway was reported to be sealed and in Good condition with no leaking detected.
- Water Clarity The water was clear; no odor or floating surface debris was noted.

Facility Safety Compliance

- External Ladder The external access ladder measured 28' in overall height with no offset landing. It was
 equipped with a vandal guard that was locked upon the crew's arrival.
- Ladder Rails and Rung(s) The rungs and rails appeared to be in satisfactory condition. The rungs were spaced at 9 ½" and had a toe depth of 5 ½". The rails measured 1 ½" in width and 1/8" in thickness, and the rail-to-rail span was 16". Standards call for the toe depth to be at least 7", and for the rails to be a minimum of 2" wide and ½" thick.
- Safety Climb The access ladder also had a cage style safety climb system. It appeared to be bolted attached to the ladder and in good working order.
- Manway The tank was equipped with a single manway measuring 45 ½ in diameter. It had a bolted support structure; no leaking was detected.
- Hatch The topside access hatch measured 30" square. The hatch lip was 4" and the overlap was 2".
- Railing The 2-piece railing ran around the perimeter of the roof and measured 42" in height. The toe rail
 was 4"; all components appeared to be in Good condition.
- Roof The inspector observed 10 safety tie-off points on the roof of the reservoir and noted that each was in Good condition.

INTERIOR RESERVOIR INSPECTION REPORT

Interior Reservoir Roof

- Vent(s) The internal penetration of the air vent was located in the center of the roof. Using the SSPC scale where 10 is the least corroded, the vent rated a "7" meaning that isolated surface corrosion was identified. See Appendix B for the SSPC legend.
- Roof Panels Keeping with the same corrosion grading scale, the roof panels rated a "6" in all quadrants.
 The inspector observed uniform surface corrosion on approximately 1% of the surface areas.
- Roof Support Structure The support structure was estimated as a "4" on the SSPC scale. Approximately 10% of the support surfaces showed corrosion. In addition, corrosion staining and dealloying was reported in all Quadrants.
- Painting Ring This tank was not equipped with a Painters Ring.
- Protective Coating The coating appeared to be in Fair condition with staining reported.

Interior Reservoir Walls

- Wall to Roof Seam This bolted area was graded as a "6" on the SSPC scale. Approximately 1% of the surface was affected by uniform surface corrosion. It appears that a foam sealant was added to this area, but due to the lower water level, the inspector could not closely evaluate the area.
- Ring Panels The middle and lower ring panels in this reservoir were assessed at a "9" showing minute
 rusting on less than .03% of the panel faces. Isolated corrosion was noted at the bolted seams.
- Interior Ladder The tank was not equipped with an interior ladder.
- Protective Coating –The wall coating showed similar staining and appeared to be in Fair condition.

Interior Reservoir Floor

- Perimeter Seam The perimeter rated a "4" on the SSPC scale; approximately 10% of the area was affected by uniform surface corrosion and concentration, no pitting was reported.
- Floor Panels The crew removed a skiff of sand-iron mixed sediment that was evenly distributed throughout the reservoir. This allowed for a thorough inspection of the floor panels, which were graded as a "9" on the same corrosion scale.
- Protective Coating The protective coating on the floor areas again showed heavy staining, a cosmetic discrepancy, and pinholes, but otherwise appeared to be in Good condition.

Interior Reservoir Plumbing Components

- Inlet Plumbing The inlet penetrated the tank in Quadrant 4 and measured 6" in diameter. The structure
 was rated a "6" as 1% of the appurtenance exhibited surface corrosion. It did appear to be operating as
 designed.
- Outlet Plumbing The outlet was positioned in Quadrant 4. The structure also measured 6" in diameter and appeared to be operating as designed. The inspector did observe uniform surface corrosion on approximately .3% of the structure and graded it as a "5" on the SSPC scale.
- Manways The manway penetrated the wall of the tank in Quadrant 2. It measured 44 ½ in diameter and
 no leaking was detected. It showed only minute uniform surface corrosion and concentration cell corrosion,
 and rated a "9" on the SSPC scale.
- Floor Drains The tank was not equipped with a floor drain.
- Overflow The interior penetration of the overflow was positioned in Quadrant 2, and measured 4" in diameter. It was assessed as a "3" on the SSPC scale with "10" being the least corroded. Approximately 17% of the structure exhibited uniform surface corrosion. The inspector also reported heavy corrosion staining coming from this area.

EXTERIOR RESERVOIR INSPECTION REPORT

Exterior Reservoir Roof

- Vent(s) The exterior portion of the vent exhibited concentration cell corrosion around the edges and on the underside of the structure. It was equipped with a fine mesh screen and rated an *8" on the SSPC corrosion grading scale.
- Roof Panels The exterior roof panels showed very isolated areas of uniform surface corrosion. Using the same scale, they were also assessed as an "8"
- Access Hatch The access hatch was graded as a "1" as 33% of the structure showed uniform surface corrosion. In addition, the inspector reported dealloying.
- Protective Coating The coating showed checks, cracks and staining, but appeared to be adequately
 protecting the roof of the tank. Dry film thickness tests performed on the roof averaged 11 mils with no
 presence of lead reported.

Exterior Reservoir Walls

- Ring Panels Upper, middle and lower panels showed no discrepancies; they rated a "10" on the SSPC scale. As noted above, see Appendix B for the SSPC legend.
- Overflow The exterior portion of the overflow was also rated a *10" on the same corrosion grading scale.
 No discrepancies were observed.
- Protective Coating The coating in this area showed similar staining to that noted on the roof, but otherwise
 appeared to be effectively protecting the tank shell. Mil thickness on the walls averaged 6 mils, and no
 presence of lead was detected.

Footings / Foundation

 Footings / Foundation – The foundation of the tank was found to be in satisfactory condition with no cracking or concrete spalling observed.

GENERAL TANK SECURITY

Security

- Fencing The tank was surrounded by security fence, which was locked when the crew arrived.
- Ladders The primary access ladder was equipped with a locking vandal guard.
- Perimeter The area surrounding the tank was well lit to deter vandalism.
- Vents The vent was not equipped with security vent shroud.
- Hatches The access hatch was locked, but not equipped with an electronic monitoring device.

SUMMARY

The overall condition of the Labrador on-grade tank appears to be Fair to Good.

The interior of the tank was rated in Fair condition. The roof and roof supports showed uniform surface corrosion ranging from a "4" to a "6" on the SSPC scale, meaning between 1% and 10% of the surfaces exhibited uniform surface corrosion and corrosion staining. In addition, dealloying was observed on the roof supports in all quadrants. The ring panels appeared to be in better condition, showing only minute rusting on less than .3% of the panel faces. The interior plumbing components did appear to be operating as designed, but each showed uniform surface corrosion on the interior and exterior portions. The interior overflow appeared to be in Poor condition, exhibiting corrosion on 17% of the structure. Considering the amount of corrosion in the reservoir, the utility should undertake some type of corrective measures. If a blast and recoat of the structure is not practical, spot touch ups should be made to the affected areas.

The exterior of the reservoir was in Good condition. The extenor roof panels and vent structure exhibited only isolated corrosion and the wall panels showed little or no discrepancy. The hatch penetration was rated a "1" on the SSPC scale, with 10 being the least corroded. Approximately 50% of the hatch showed uniform surface corrosion and dealloying was also observed. In addition, the hatch was not properly sealed. The utility should consider repairing or replacing the hatch, and at a minimum should install a gasket on the existing hatch to ensure a proper seal. In an effort to bring the tank to optimal condition, the utility should also consider increasing the rail width from the current 1 ½" to a 2" minimum, and the rail thickness from 1/8" to at least ½".

At a minimum, the utility should continue to clean and inspect this tank every three to five years. Preventive maintenance of this nature will ensure that the identified discrepancies in this tank are closely monitored and will provide a record of care in the future.

(As a disinterested third-party inspector, LEC does not engage in the construction or rehabilitation of potable water storage facilities. LEC will, in its commitment to our clients and upon request, identify to the client relevant entities that are professionally reliable and best capable of completing the recommended work, or assist the client in research tips that will enable them to make a decision that best serves the utility.)

Labrador Utilities, Inc. 200 Weathersfield Ave. Altamonte Springs, FL 32714

RE: ECO-2000, Inc.

Project: Forest Lake Estates Wastewater Treatment Facility Odor Control System, 41311

Paquette Way, Zephyrhills, FL

Project Scope: Construction of an Odor Control System to service three steel digester

tanks and two flow equalization tanks.

Estimate: \$650,000.00

To Whom It May Concern,

We are the surety agents for ECO-2000, Inc. Bonds are currently written through United Fire & Casualty Company which is Best Rated "A, X" and has a Treasury Listing of \$48,646,000.00.

We anticipate no difficulties in providing surety bonds for ECO-2000, Inc. in the \$750,000 single, \$750,000 aggregate range. In the event that ECO-2000, Inc. is low and awarded this project, we would not anticipate any difficulties in providing the necessary performance and payment bonds, subject to normal underwriting requirements. The cost of the bond would be approximately \$10,800.00. This letter is not a commitment to provide any bonds unless all underwriting requirements including contract review are met prior to issuing any bonds. Neither our agency, nor the surety are liable for any damages relating to this letter or project.

Should you have any questions, please do not hesitate to contact us.

Sincerely,

Kim E. Niv Vice President

Kim E. nw
