Re: Docket No. 160060-EC – Complaint and petition of the City of Cape Coral for an investigation into the rate structure of Lee County Electric Cooperative, Inc.

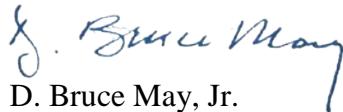

Dear Ms. Stauffer:

On behalf of Lee County Electric Cooperative, Inc. (“LCEC”), attached are LCEC’s responses to Staff’s First Data Request in the referenced docket. For ease of reference, Staff’s Data Requests are repeated verbatim in the attached, with LCEC’s responses immediately following.

If there are any questions regarding this transmittal, please contact me at (850) 425-5607. Thank you for your consideration.

Sincerely,

HOLLAND & KNIGHT LLP

Docket No. 160060-EC
LCEC's Responses to Staff's First Data Request

- 1. Does LCEC have location-specific asset information? If yes, please describe how detailed the information is, for example, account-specific investment by city/municipality and by street. If not, please describe in detail the process it would take to develop such information and provide an approximate cost, and include the basis for the cost.**

Response:

No. LCEC adheres to the RUS uniform system of accounts and the *Electric Utility Cost Allocation Manual* published by the National Association of Utility Regulatory Commissioners (“NARUC”), which do not require LCEC to maintain location-specific asset or expense data. Consequently, LCEC does not maintain records that detail account-specific investments or expenses by geographic area, municipal region, or street. As explained in detail below, to develop costs by geographic area would require significant time and expense.

To determine location-specific costs, LCEC would need to perform a geographic separation study to examine cost differences between serving customers in various geographic locales based on a variety of geographical, topographical, customer service, and load characteristic information. Any such process would need to provide flexibility to account for cost differences and load characteristics specific to any geographical boundaries ultimately considered. This would allow LCEC to run scenario analyses to determine alternative geographic boundaries to be considered based on various homogeneous factors (i.e., factors that are like and similar in some statistically significant manner). Notably, however, it would not be possible to construct a costing model of LCEC’s distribution system that could accurately identify the installed cost of every single plant item in such a way that the model could calculate cost differences with a high degree of certainty. Any such analysis of LCEC’s distribution system would be an estimate, with varying degrees of accuracy depending on the complexity and sophistication of the analysis, and would have to be performed based on a set of predetermined assumptions.

Furthermore, determining the appropriate geographic regions to be considered is not as simple as establishing the regions based on the boundaries of incorporated municipalities. Factors that would need to be considered such as density, topographical features, customer service, load characteristics, and proximity to transmission substations do not necessarily vary based on municipal boundaries. For example, LCEC has unincorporated areas within its service territory that have higher member densities per mile than in incorporated areas.

Performing a geographic separation study and designing rates accordingly would require a series of steps, which are described below.

Step 1.

The first step would be to determine the factors that should be used to separate costs for various geographic regions. Such factors would include characteristics such as miles of overhead distribution lines per customer, miles of underground distribution lines per customer, methods used for installing underground facilities, load characteristics of customers, voltage level of the facilities used, conductor size and type utilized, transformer size and type installed, etc. Using those characteristics, LCEC could then identify specific geographic areas within its service territory that would be considered homogeneous with respect to certain characteristics. It is anticipated that any set of factors that would be used to define geographic regions with homogeneous characteristics would need to be first approved by the Commission, otherwise the study to aggregate costs based on those definitions might need to be performed multiple times if there is disagreement on LCEC's definition of homogeneous geographic regions. It is also anticipated that the Commission would want uniformity in the way geographic areas are defined for purposes of imposing location-specific asset and expense recordkeeping requirements so that all electric utilities in the state receive equal treatment.

Once the characteristics for defining homogeneous geographic regions are determined and agreed upon, LCEC would have to use mapping data and manual customer counts to draw boundaries within its service territory that correspond to the predetermined characteristics. This would be a very time-consuming process and is estimated to cost between \$300,000 and \$500,000. This range is based on a high-level estimate developed by LCEC's rate consultant.

Step 2.

Once the homogeneous geographic regions have been defined and their boundaries drawn, the second step would be to perform a detailed inventory of LCEC's assets for the geographic regions previously determined. LCEC would need to identify (i) assets (such as transmission lines, substations, and certain primary distribution lines) that are jointly used to serve all regions, (ii) assets that are jointly used to serve multiple (but not all) regions, and (iii) assets that are exclusively used to serve individual regions. The associated operation and maintenance expenses also would have to be tracked for each of three groups of costs ("Cost Groupings"). The process of conducting a detailed inventory by geographic region would have to be accomplished manually and by physical inspection. It is estimated that the process of taking a plant inventory would cost between \$1,200,000 and \$1,800,000. This estimate is based on a previous study that was performed by LCEC in 2006 to identify cable TV and communication attachments on its poles.

It should be noted, however, that geographic regions can never be considered static. As customer concentration and service characteristics within geographic regions change over time due to growth or decline of customer count and load, the inventory of assets would no longer

reflect the previously determined boundaries. Unless an entirely new asset and financial accounting model could be developed that is sophisticated enough to assign assets to individual customers (both new and existing customers), it would be necessary to take new inventories of system assets periodically as the boundaries of the homogeneous geographic regions inevitably will change over time. Determining customer-specific assets would increase the cost estimate indicated above.

Step 3.

The third step that would be to modify LCEC's accounting system to track plant additions, depreciation, and retirements by the three Cost Groupings described in *Step 2*. The system also would have to track associated O&M expenses by these Cost Groupings. These functions would need to be tied into LCEC's other accounting systems and then tested. Additionally, field personnel would have to be trained on how to record their time so that labor costs are properly capitalized and expensed according to the three Cost Groupings. It is estimated that the cost of system programming required to modify the accounting system and the cost of training the field employees would be between \$300,000 and \$400,000. This range is based on estimates developed by LCEC's information systems contractor and rate consultant.

Step 4.

The fourth step would be to conduct a cost of service study based on geographic costs, which would be much more complicated than a traditional cost of service study as a study based on geographic costs would have to be performed for each geographic region. Moreover, where a traditional cost of service study would have one section for functionalizing and classifying costs, a geographically differentiated study would require at least three sections, one for each of the Cost Groupings described above. The study would then have to allocate all backbone (jointly used) assets to each geographic region based on appropriate allocators. The resulting functionalized and classified costs for each region would then be allocated to rate classes for each region. It is estimated that a cost of service study using this methodology would cost between \$50,000 and \$70,000. This estimate is based on information provided by LCEC's rate consultant.

Step 5.

The fifth step would be to (i) redesign LCEC's rate schedules based on geographic costs and (ii) reprogram its billing system to set rates by geographic region. More than likely, the number of LCEC's rate schedules would have to be at least doubled because there would be at least two sets of charges on every existing rate schedule based on a minimum of two geographic regions. The number of additional rate schedules could increase by a factor of more than two if it is determined that there should be more than two geographic regions, which is highly likely. The billing system would have to be reprogrammed so that all current members/customers have a

new rate code designation based on geographic area. Then geographic designations would have to be manually changed in the system for each customer. The field employees would also have to be trained on the new rate schedules and codes so that as new members/customers take service they are accurately tracked in the billing system. LCEC has over 200,000 customers, so this is not a small undertaking. It is estimated that this step could cost between \$430,000 and \$650,000. This range is based on estimates developed by LCEC's information systems contractor and rate consultant. The most significant part of this cost would be recoding the geographic designations for each customer. It is estimated that recoding the customer designations would require over 7,600 man-hours of labor. This estimate was developed by LCEC's rate consultant based on input from LCEC.

In total, we estimate that the geographic cost of service approach suggested by Cape Coral would cost between \$2,280,000 and \$3,420,000, as summarized below:

Step #	Task Description	Cost Estimate	
		Low Case	High Case
1	Identify Geographic Regions with Homogeneous Customer Density or Other Characteristics	\$300,000	\$500,000
2	Inventory assets by Cost Grouping: (1) Assets that are jointly used to serve all regions (2) Assets that are jointly used to serve multiple regions (3) Assets that are used exclusively to serve individual regions	\$1,200,000	\$1,800,000
3	Modify accounting systems to track plant additions, plant retirement, and operation and maintenance expenses and provide training to employees in the use of the new systems	\$300,000	\$400,000
4	Perform an embedded cost of service study based on rates for multiple geographic regions	\$50,000	\$70,000
5	Redesign rates and customer billing systems to bill rates for multiple geographic regions	\$430,000	\$650,000
Total Cost Estimate		\$2,280,000	\$3,420,000

However, it is important to note that many of these costs are not one-time expenditures. A cost of service study and rate design study is a recurring cost. Recurring costs would also include the additional time and expenses of tracking assets by geographic region and the additional time and expenses of tracking customers by geographic region. Over time, some regions in LCEC's service territory would likely grow and others could even decline. Therefore, the characteristics of previously determined geographic regions would be in a constant state of flux. To administer

rate distinctions by geographic region in a consistent manner, the system would have to be reevaluated at periodic intervals and the geographic regions redrawn based on current information. Redrawing the geographic boundaries would likely require LCEC to take new inventories of its system assets to match the new geographical boundaries or at the very least re-categorizing the asset inventory base on new boundaries. Those costs would recur at periodic intervals. When accounting systems and billing systems are updated and replaced, the additional complexity would add to the implementation costs of those systems.

2. Please describe with specificity the steps (and associated costs) LCEC would need to take to conduct a cost of service based on density, such as what the City of Cape Coral wants. How long would this type of study take and what is LCEC's estimate of the cost?

Response:

In order to develop a cost of service study based on customer density as requested by the City of Cape Coral, LCEC would first need to perform the work outlined in its response to Staff's Data Request No. 1, which would include (i) determining the density and other factors that should be used to separate costs for various geographic regions, (ii) conducting a detailed inventory of LCEC's assets for the geographic regions previously determined, and (iii) modifying LCEC's accounting system to track plant additions and retirements by the three Cost Groupings described above.

Only upon completion of that work could LCEC begin to develop a cost of service study based on density. A cost of service study based on geographic density would require LCEC to perform multiple cost of service studies—one for each density-based region identified for the utility. As described in the response to Staff Data Request No. 1, a regionally differentiated cost of service study based on density differences would have to functionalize and classify distribution costs for each geographic region and for backbone or joint use assets that are used to provide service to multiple or all regions. Where a typical study would have one section for functionalizing and classifying costs, this study would have at least three. The study would then have to allocate all backbone assets to each geographic region based on appropriate allocators. The resulting functionalized and classified costs for each geographic region then would need to be allocated to the rate schedules for each region based on allocation factors that take into account the load and customer characteristics for each geographic region. In addition to redesigning its rate schedules, LCEC would be required to reprogram its billing system to set rates by geographic region based on density. Designing rates for multiple geographic regions also would add to the complexity of designing rates. A proof of revenue and billing analysis would have to be performed for each geographic region.

In total, we estimate that developing a cost of service study and rate structure based on geographic density as suggested by Cape Coral would require approximately 18 to 24 months and cost between \$2,280,000 and \$3,420,000, as described in the above response to Staff Data Request No. 1.

Finally, while it may be theoretically possible to perform a cost of service study based on geographic distinctions, such an approach is not consistent with standard industry practices. The standard treatise on cost of service studies is NARUC's *Electric Utility Cost Allocation Manual*. The *Electric Utility Cost Allocation Manual* does not address methodologies that allocate fixed costs geographically, or based on customer densities.

3. What is the date of LCEC's most recent cost of service study? Please provide a copy of the study.

Response:

LCEC's most recent cost of service study was completed based on a test year using the twelve months ended September 2007, and was performed by The Prime Group, LLC. See attached. The study uses industry standard cost allocation methodologies as discussed in the NARUC *Electric Utility Cost Allocation Manual*. It does not assign costs based on geographic location.

4. Does LCEC currently have a cost of service study in process? If yes, does the study address the use of density in determining customer classes and rates? If yes, when will the study be finished?

Response:

Before the City of Cape Coral filed its complaint with the Commission, LCEC had already retained The Prime Group LLC to conduct a cost of service study in 2015 based on the twelve months ended December 2014. That study would have been a traditional cost of service study using NARUC cost allocation methodologies and therefore would not have addressed density or other geographic distinctions in determining customer classes or rates. When the issue with Cape Coral arose, LCEC instructed The Prime Group to stop working on the project until such time that this issue was resolved. LCEC did not want to continue to spend resources on that study if there was a possibility that it would be asked by the Commission to begin a new study using a novel and completely different methodology.
