Re: Docket No. 870098-EI

Dear Mr. Tribble:

Enclosed for filing are fifteen (15) copies of the Testimony and Exhibits of Florida Power & Light Company's witnesses, Messrs. R. R. Denis, E. L. Hoffman, G. G. Kuberek and T. S. LaGuardia in the above docket.

Respectfully submitted,

Matthew M. Childs, P. A.

**BEFORE THE FLORIDA PUBLIC SERVICE COMMISSION  
FLORIDA POWER & LIGHT COMPANY  
TESTIMONY OF ROBERTO R. DENIS  
DOCKET NO. 870098-EI**

**February 27, 1989**

1 Q. Please state your name and business address.

2 A. My name is Roberto R. Denis, and my business address is 9250 West  
3 Flagler Street, Miami, Florida.

4

5 Q. Who is your employer and what position do you hold?

6 A. I am employed by Florida Power & Light Company (FPL) as Director of  
7 System Planning.

8

9 Q. Please describe your educational and professional background and  
10 experience.

11 A. I received a Bachelor of Science degree, with Honors, in Electrical  
12 Engineering from Georgia Institute of Technology in 1972. In 1976,  
13 I completed an FPL sponsored course in the area of Nuclear Power.  
14 I have since attended numerous courses and seminars at Auburn

1 University, the General Electric Company, Ohio State University, and  
2 other industry associations.

3  
4 I am a registered Professional Engineer in the State of Florida, and  
5 a member of the Florida Engineering Society and the Institute of  
6 Electrical and Electronic Engineers. I also represent FPL in the  
7 Interconnections Arrangements Committee of the Edison Electric  
8 Institute and at the System Planning Committee of the Florida  
9 Electric Power Coordinating Group.

10  
11 Upon graduation in 1972, I was employed by FPL as a distribution  
12 engineer in FPL's Southeastern Division. In 1976, I joined the  
13 System Planning Department, where I was promoted to the position of  
14 Supervisor of Generation Planning in 1980. In 1982, FPL formed the  
15 Load Management and Customer Generation Department, at which time  
16 I was promoted to the position of Manager of that department. In  
17 1985, I joined the Power Supply Department as the Manager of  
18 Contracts and Administration. In January of 1989, I assumed my  
19 present position as Director of System Planning.

20  
21 In my present position, I am responsible for the evaluation of the  
22 Company's future need for power supply and transmission facilities  
23 and for the formulation of plans to satisfy such needs.

24  
25 Q. What is the purpose of your testimony?

1       A.    The purpose of my testimony is to discuss several factors which  
2            limit FPL's ability to make a definitive determination at this time  
3            regarding the ability to reuse any of the components or facilities  
4            at the Turkey Point and St. Lucie sites after nuclear  
5            decommissioning takes place.

6

7       Q.    Have you prepared or caused to be prepared under your supervision,  
8            direction or control an exhibit for presentation in this proceeding?

9       A.    Yes, I have. It consists of one document and it is attached to my  
10            testimony. This document shows the time frame in which nuclear  
11            decommissioning is anticipated.

12

13      Q.    Are there any components now at the nuclear units which could be  
14            retained to generate electricity with another steam source after the  
15            removal of the current nuclear steam generation components?

16      A.    The answer to this question is dependent on many factors which are  
17            unknown at this time and which will remain unknown during the  
18            foreseeable future. Components with potential for reuse after  
19            decommissioning would certainly be limited to the nuclear non-  
20            contaminated, components. These would primarily include portions  
21            of the turbine-generator power block, cooling system and electrical  
22            grid interconnecting facilities. The usability of these components  
23            however, will depend on the wear-and tear status at the time reuse  
24            is commenced.

1 Q. Will the age of these facilities have an impact on their ability to  
2 be reused?

3 A. Yes. It should be pointed out that, at the time of decommissioning,  
4 any remaining equipment will have been in service as long or longer  
5 than its expected life, assuming full-term operation of the units.

6  
7 While it can be hypothesized that equipment will remain in usable  
8 condition, possibly subject to some refurbishment, the benefits of  
9 this "recycling" can only be evaluated in light of then existing  
10 environmental, economic and strategic concerns. Our ability to  
11 predict what these conditions may be in the long term is limited and  
12 makes such analyses highly speculative.

13

14 Q. Could you please explain the problems with such long-term  
15 prediction?

16 A. Yes. In order to put my discussion in perspective, Document No. 1,  
17 attached to my testimony, contains a table which attempts to specify  
18 the horizon for our predictions. The table shows that based on the  
19 recommended decommissioning approach, it will be 25 years from the  
20 present time before decommissioning is completed at the Turkey Point  
21 site and 39 years at the St. Lucie site. If we then were to add  
22 from five to ten years to those figures for permitting and  
23 construction of the facilities which would make use of such  
24 equipment, it is evident that equipment reuse is highly speculative  
25 given the uncertainties surrounding conditions at that time. The

1 normal planning horizon at FPL for making decisions on capacity  
2 needs and technology selection is 20 years.

3  
4 Q. Does the time period between the start and completion of  
5 decommissioning contribute to the uncertainty?

6 A. Yes. When the nuclear units are taken off-line and decommissioning  
7 commences, replacement capacity will likely be needed. Thus,  
8 whether additional capacity would be required after decommissioning  
9 is complete, several years later, is difficult to estimate.

10  
11 It is my opinion that it is not reasonable or meaningful to attempt  
12 to predict the usability of any equipment at these two sites  
13 anywhere from 30 to nearly 50 years from now, because of the many  
14 uncertainties.

15  
16 Q. Are there uncertainties in addition to whether the non-contaminated  
17 equipment and facilities will be in good working order and reusable?

18  
19 A. Yes. As I mentioned before, if one wished to assume that certain  
20 equipment were usable, then it is necessary to consider whether it  
21 would be reasonable to reuse it. Since the time period we are  
22 dealing with is beyond that in which results from any economic  
23 planning exercise would be meaningful, other factors which affect  
24 the usefulness of any of the equipment or facilities would need to  
25 be evaluated.

21  
22  
23  
24  
25

Q. Please discuss these factors.

A. The first major hurdle, independent of the status of the equipment and facilities that must be overcome, is the permitting requirements under the Power Plant Siting Act. The permitting requirements under this Act fall in two general steps: 1) a Determination of Need, and 2) Site Certification/Environmental licensing.

Authority over the first of these is with this Commission and its objectives are to establish the need for the electrical facilities and to determine that the proposed facilities are *the most economical alternative available to the utility*. To satisfy the first requirement under the Siting Act, the type, size and timing of such facility must reasonably match the electrical demand of the Company's customers.

Whether reuse of the facilities is the most economical alternative to meet the electrical demand of FPL's customers is, however, more difficult to predict. It is not known whether repowering of these units is going to be economical at all 30 years from now. It is very difficult (if not impossible) to venture an answer to this question. As we look at historical technology innovations, it is likely that in 30 years or more we may be looking at a completely different technology for electric power generation. The answer to whether repowering will be an economically viable option for these

1 units in that time frame is very unpredictable at this time.  
2 Therefore, even if there is equipment which could technically be  
3 reused, serious doubts exist that it may be the economical thing to  
4 do.

5  
6 The second of the permitting steps poses even more formidable  
7 obstacles to being able to ascertain the ability to reuse equipment  
8 or facilities at the sites. One question is clear, whatever use is  
9 given to the sites for further power production must be compatible  
10 with the environment at that time or it will not be feasible to  
11 reuse the facilities. The location of both sites is such that the  
12 repowered facility would most likely be limited to a gaseous fuel  
13 which could be piped into the site. Solid fuels, such as coal,  
14 would require extensive transportation systems which neither site  
15 currently has. Oil most certainly will not be an economical fuel.  
16 Repowering with new nuclear reactors at those sites presents a  
17 greater political uncertainty than it is today. Therefore, the only  
18 foreseeable means of repowering at this time, from a fuel and  
19 environmental requirements standpoint, is the use of combustion  
20 turbines with heat recovery steam generators (CT/HRSG) to produce  
21 steam to turn the existing turbine generators.

22  
23 Q. Have you performed any analyses to determine the feasibility of  
24 repowering these sites?

1 A. Yes, I have. However, it should be noted that repowering of a  
2 nuclear unit which has begun operation has not been done to date.  
3 Projects at Midland and Zimmer involve plants which had not been  
4 completed. My analysis shows that full repowering of the nuclear  
5 units at the Turkey Point site requires eleven 150 MW combustion  
6 turbine HRSG sets per unit for a total repowered capacity of 4,840  
7 MW for the two units. At St. Lucie, the requirements are for  
8 thirteen 150 MW combustion turbine HRSG sets per unit for a total  
9 site capacity of 5,600 MW.

10  
11 The basis for these requirements is that full repowering would be  
12 most attractive, and therefore pose the most economical alternative  
13 if the efficiency gains could be achieved for the entire capacity  
14 of the existing turbine generators.

15  
16 Q. What do you mean by full repowering?

17 A. Full repowering involves total replacement of the steam supply  
18 system by combustion turbine HRSG sets. These CT/HRSG sets can  
19 provide the steam conditions necessary to drive an existing steam  
20 turbine generator at the site.

21  
22 Q. Is partial repowering of the units an option?

23 A. The MW requirements detailed above assume that the entire steam  
24 volume necessary to drive the existing steam turbine generator would  
25 be provided by the CT/HRSG sets. Another possibility would be to

1 provide some of the steam using a new or existing boiler and provide  
2 only partial requirements from the CT/HRSG sets. This is known as  
3 partial repowering. Use of the existing steam generator is not a  
4 viable option, since it is part of the "contaminated" system, and  
5 a new boiler as a practical matter, would probably not be economical  
6 since the partial repowering option results in reduced overall  
7 efficiencies compared to a full repowering. Partial repowering is,  
8 therefore, an unlikely option.

9  
10 These analyses in turn raised some critical concerns with regards  
11 to land availability at the sites, fuel availability, water use and  
12 transmission line requirements.

13  
14 **Q. Could you please summarize these concerns for each site?**

15 **A. Yes, they are as follows:**

16 **Turkey Point**

- 17 1) A total of 50 acres of land would be required to install the  
18 new facilities and accessories for a full repowering of both  
19 units. Configuration of the unit may be difficult within  
20 current site boundaries.
- 21 2) Up to 950,000,000 standard cubic feet per day of gas would be  
22 required to support the repowered units. There is currently  
23 no gas pipeline into this site and this volume represents over  
24 100% of the currently planned Florida Gas Transmission  
25 capacity into the entire state of Florida.

- 1           3)    An additional 2,000 gallons per minute of fresh water would  
2                    be required to support the combustion turbines.  
3           4)    A minimum of an additional three 230kV circuits would have to  
4                    be added into the plant site, preferably on a separate  
5                    corridor, to export the total site generation, which would be  
6                    greater than existing site capacity.

7           St. Lucie

- 8           1)    A total of 60 acres of land would be required to install the  
9                    new facilities and accessories for a full repowering.  
10                   Configuration of the unit may be difficult within current site  
11                   boundaries.  
12           2)    Up to 1,120,000,000 standard cubic feet per day of gas would  
13                   be required to support the repowered units. There is  
14                   currently no gas pipeline into this site and this volume  
15                   represents 120% of the currently planned Florida Gas  
16                   Transmission capacity into the entire state of Florida.  
17           3)    An additional 2,400 gallons per minute of fresh water would  
18                   be required to support the combustion turbines.  
19           4)    A minimum of an additional four 230kV circuits would have to  
20                   be added into the plant site, preferably on a separate  
21                   corridor, to export the total site generation, which would be  
22                   greater than existing site capacity.

23  
24        Q.    What do you conclude from all this?

1 A. I believe that even without concluding whether there will be  
2 equipment and facilities at the Turkey Point and St. Lucie sites  
3 that are capable of being reused, there are significant  
4 uncertainties regarding the physical requirements of repowering an  
5 existing turbine-generator power block which prevent a final  
6 determination of whether or not there is any practical or economic  
7 use of equipment currently at those sites.

8  
9 Q. If the equipment has no practical or economic value, what use do you  
10 foresee for the land, cooling systems and transmission facilities  
11 currently at each site?

12 A. The future use of these presents a different question than  
13 ascertaining the use of existing power block equipment. Setting  
14 aside the reuse of existing power block equipment which itself  
15 creates questions because of the specific application, reuse of the  
16 sites themselves could be highly beneficial.

17  
18 These sites are already developed with regards to cooling systems  
19 and transmission facilities. The sites are in near proximity to  
20 load centers providing for generation and load balance objectives  
21 which add to system reliability. Availability of new generation  
22 sites in the load areas surrounding these existing sites is  
23 questionable.

1           In the future, generating technology breakthroughs could very well  
2           make these sites usable. A clear advantage of all this would be  
3           that reuse of the sites in a manner which does not cause  
4           unacceptable environmental impact in either of the two locations  
5           could satisfy the needs of a growing Florida in an environmentally  
6           acceptable manner.

7

8        Q.    Does this conclude your testimony?

9        A.    Yes it does.

Florida Power & Light Company  
Nuclear Decommissioning Table

---

<u>Unit</u>	<u>Year of License Expiration</u>	<u>Year of Complete Decommission<sup>1/</sup></u>	<u>Years of Lapsed Time<sup>2/</sup></u>
Turkey Pt. No. 3	2007	2013	24
Turkey Pt. No. 4	2007	2014	25
St. Lucie No. 1	2016	2028	39
St. Lucie No. 2	2023	2028	39

1/ Based on recommended decommissioning approach contained in testimony of FPL Witness Thomas S. LaGuardia.

2/ Time lapsed from present day. This would be the time lapsed to the first day any re-usable equipment would be available for other use from the present. It does not reflect the permitting and construction time request for any such reuse.

Docket No. 870098-EI  
FPL Witness: Roberto R. Denis  
Exhibit 1. Document No. 1  
Page 1 of 1

E. L. HOFFMAN

**BEFORE THE FLORIDA PUBLIC SERVICE COMMISSION**  
**FLORIDA POWER & LIGHT COMPANY**  
**TESTIMONY OF EDGAR L. HOFFMAN**  
**DOCKET NO. 870098-EI**  
**FEBRUARY 27, 1989**

1 Q. Please state your name and business address.

2  
3 A. My name is Edgar L. Hoffman, Jr., and my business address is 9250 West Flagler  
4 Street, Miami, Florida 33174.

5  
6 Q. By whom are you employed and in what capacity?

7  
8 A. I am employed by Florida Power & Light Company (Company) as Treasurer and  
9 Director of Finance.

10  
11 Q. What is the purpose of your testimony?

12  
13 A. To request consideration from the Commission for an increase in the Company's  
14 revenue requirements as they relate to the estimated costs associated with  
15 decommissioning the Company's four nuclear units at the St. Lucie and Turkey  
16 Point sites. The basis for this request is an updated engineering study  
17 performed by the independent consulting firm of TLG Engineering Inc. (TLG)  
18 which estimates an increase in the nuclear plant decommissioning costs upon  
19 which the current cost of service amounts are based. Additionally, my

1 testimony is meant to present responses to issues related to the process of  
2 Nuclear Plant Decommissioning as it relates to those parts of the Studies filed  
3 with the Commission in 1988 for which I am the primary witness.  
4

5 Q. Please describe your educational and professional background and experience.

6  
7 A. In January 1972, I graduated from the University of Wisconsin - Milwaukee  
8 with a Bachelor of Business Administration degree and received a Master of  
9 Business Administration degree in December 1974 from the same University.  
10

11 In December 1971, I was employed by Wisconsin Electric Power Company,  
12 starting as a Financial Analyst and ultimately attained the position of Project  
13 Analyst. In 1978, I accepted the position with Florida Power & Light Company  
14 as a Senior Financial Analyst in the Finance Department. In 1980 I was  
15 promoted to Coordinator of Financial Planning and to Manager of Financial  
16 Analysis and Forecasts in December 1981. From December 1985 through May  
17 1986 I was the Manager of Regulatory Accounting and Research. In June 1986  
18 I was promoted to Director of Finance and Assistant Treasurer and to my  
19 current position as Treasurer and Director of Finance in January 1987.  
20

21 Q. Are you sponsoring any schedules included in the Exhibits section of this filing?  
22

23 A. No, I am not.

1 Q. Before discussing the costs of nuclear decommissioning, what methodology is  
2 considered to be most appropriate by the Company for purposes of  
3 decommissioning its four nuclear units?  
4

5 A. Based on the Decommissioning Cost Studies prepared by TLG and the  
6 recommendation of Thomas S. LaGuardia of TLG, the Company's  
7 Decommissioning Steering Committee comprised of various Company executives,  
8 decided on the most appropriate decommissioning methodology for each of the  
9 Company's two nuclear sites. The Company chose to decommission its facilities  
10 in what may be considered a prompt, yet integrated manner. Factors considered  
11 in reaching a decision on the appropriate decommissioning methodology  
12 included cost, logistics, health, safety, security and the future regulatory  
13 environment.  
14

15 The prompt (and integrated) decommissioning methodology is the least expensive  
16 of the conventional decommissioning alternatives (as defined in the Nuclear  
17 Regulatory Commission's (NRC) Nuclear Decommissioning Rule issued on June  
18 27, 1988 and made effective July 27, 1988) available to the Company for both  
19 of its plants. As estimated by TLG, delayed decommissioning methods were  
20 anywhere from 11.3% to 23.7% more expensive for the St. Lucie Plant and from  
21 11.2% to 30.4% more expensive for the Turkey Point Plant. Other important  
22 considerations dealt with eliminating potential uncertainties associated with a  
23 prolonged period of plant dormancy or entombment. Health and safety concerns  
24 related to a nuclear plant which sits idle for a prolonged period of time raise  
25 many unanswered questions. Concern for these health and safety uncertainties

1 were expressed by the NRC in its Nuclear Decommissioning Rule. Absent any  
2 clear showing of why a nuclear plant should be decommissioned on a delayed  
3 basis, the NRC recommended prompt dismantlement. Lastly, the prompt  
4 decommissioning methodology limits the Company's exposure to potentially  
5 costly regulatory actions which could be imposed on utilities having plants that  
6 remain dormant or entombed for extended periods of time.

7  
8 Each of the two sites - St. Lucie and Turkey Point - has two units. Consequently,  
9 it is necessary to integrate the decommissioning process so that, at each site  
10 decommissioning of both units is performed simultaneously.

11  
12 The current license expiration date for each of the two units at the Turkey  
13 Point Plant is April 27, 2007. Because of identical license expiration dates,  
14 preparations for and the activities associated with decommissioning occur in an  
15 integrated fashion over very much the same period of time. The terminology  
16 used by TLG to describe this methodology in its Turkey Point Decommissioning  
17 Cost Study is Integrated Prompt Removal/Dismantling.

18  
19 A similar approach is planned for the St. Lucie Plant. However, current license  
20 expiration dates for Unit Nos. 1 and 2 are March 1, 2016 and April 6, 2023  
21 respectively. Given this seven year difference in license expiration dates and  
22 the Company's decision to integrate the decommissioning process, it will be  
23 necessary to prepare (through what is termed "mothballing") Unit No. 1 for a  
24 period of dormancy. This dormancy period will last until the license expiration  
25 date of Unit No. 2, at which time the decommissioning activities for both units

1 will occur in an integrated fashion over the same period of time. The  
2 terminology used by TLG to describe this methodology in its St. Lucie  
3 Decommissioning Cost Study is Mothball/Prompt-Integrated Station Dismantling.

4  
5 The integrated approach to decommissioning allows for a one time mobilization  
6 of personnel and equipment necessary to decommission the units at each of the  
7 two sites. The Company believes a one time mobilization effort will help to  
8 eliminate the potentially significant logistical considerations and costs necessary  
9 to organize resources at two different moments in time. Additionally, one time  
10 mobilization of resources allows for experience gained in the decommissioning  
11 of one unit to be more easily applied to the decommissioning processes at  
12 another unit.

13  
14 Integrating the decommissioning process helps to eliminate concerns over having  
15 to secure one facility which is operating, from a unit which is being  
16 decommissioned. Congestion associated with decommissioning one unit could  
17 pose security problems at a site where another unit is still being operated.  
18 Important operational and safety considerations deal with the potential hazards  
19 associated with blasting activities necessary to complete the decommissioning  
20 process. Activities such as this which occur in close proximity to another unit  
21 which may still be operational, raise questions concerning the safety of  
22 continuing plant operations and its personnel. All of the previously mentioned  
23 points are especially true at the St. Lucie Plant, where license expiration dates  
24 are significantly different from one another.

1 Q. For the decommissioning methodology selected by the Company, what is the  
2 estimated appropriate cost in current (1988) dollars to decommission each of the  
3 nuclear units?  
4

5 A. The cost estimates contained in the Decommissioning Cost Studies approved by  
6 the Company were expressed in 1987 dollars. Using the escalation rate  
7 methodology discussed in testimony which follows, the estimated 1987 costs were  
8 escalated by the Company and expressed in 1988 dollars. The escalation rate  
9 methodology used produced slightly different rates for each of the four nuclear  
10 units in 1988. Given below, for each of the four nuclear units are the 1988  
11 escalation rates as derived and the estimated future costs of decommissioning  
12 in 1988 dollars.  
13

	1988	Estimated Future Costs
<u>Unit</u>	<u>Escalation Rate</u>	<u>in 1988 Dollars</u>
16 St. Lucie No. 1	4.16%	\$206,557,821
17 St. Lucie No. 2	4.14%	204,031,505
18 Turkey Point No. 3	4.21%	163,143,465
19 Turkey Point No. 4	4.17%	191,618,110

20  
21 These costs were escalated to 1988 based on the Company's November 1987  
22 Inflation Rate Forecast. An updated Inflation Rate Forecast is expected to be  
23 completed by the Company's Research, Economics and Forecasting Department  
24 in May 1989. The effect of this upcoming forecast on the above cost estimates  
25 is not known at this time but will be provided to the Commission when

1 available.

2

3

Q. What methodology and escalation rate were used to convert the current estimated decommissioning cost to the future decommissioning estimated cost?

4

5

6

A. Summary explanations of the escalation rate methodology and detailed calculations of the rates used to escalate the 1987 decommissioning cost estimates provided by TLG are provided in each of the 1988 Decommissioning Cost Studies filed with the Commission. Following is a further explanation of the escalation rate methodology used by the Company.

7

8

9

10

11

12

The decommissioning process consists of several activities. These activities have been summarized in the Company's Decommissioning Cost Studies as: Decontamination, Removal, Packaging, Shipping, Burial, Staff and Other. The costs associated with each activity can be expected to increase at different rates throughout time. An escalation rate methodology which considers the potential for escalation rate differences between decommissioning activities was used.

13

14

15

16

17

18

19

20

21

22

23

24

25

The Company's methodology considers the current and projected costs of each of the above decommissioning activities separately for purposes of computing an overall, or average escalation rate. Each of the previously defined decommissioning activities is separated further into three component parts; labor, material and other. The proportionate cost (in 1987 dollars) for each of these three components was provided to the Company by TLG Engineering Inc. Using the decontamination activity for St. Lucie Unit No. 1 as an example, the

1           proportion of labor, material and other costs as a percentage of total costs for  
2           the Decontamination activity was 65.5%, 34.5% and 0.0% respectively.

3  
4           With each of the decommissioning activities separated into labor, material and  
5           other components, the inflation index, from the Company's official November  
6           1987 Inflation Rate Forecast, which was believed to best characterize future  
7           escalation of each cost component was determined. The inflation index used  
8           for the labor component, depended on whether it was craft or staff labor. An  
9           Average Hourly Earnings Index for construction workers was used for craft  
10          labor. Staff labor was escalated using a similar Average Hourly Earnings Index  
11          for service workers. The Producer Price Index (for capital equipment) and the  
12          GNP Deflator were used to escalate material and the other cost components,  
13          respectively.

14  
15          The escalated costs for each of the different decommissioning activities were  
16          determined for each year of the Study. Summing the escalated costs of all  
17          activities for a particular year and comparing this cost relative to the previous  
18          year's cost provided the annual escalation rate for the total decommissioning  
19          process from one year to the next. This process was repeated for each of the  
20          four nuclear units over the applicable analytical horizon.

21  
22          An overall effective rate, equivalent to the year by year rates was determined

1 for each unit and are shown below.

2	<u>Unit</u>	<u>Overall Escalation Rate</u>
3	St. Lucie Unit No. 1	5.5%
4	St. Lucie Unit No. 2	5.4%
5	Turkey Point Unit No. 3	5.4%
6	Turkey Point Unit No. 4	5.4%

7

8 Q. Given this escalation rate methodology, what is the total estimated cost of  
9 decommissioning each unit in future dollars based upon the present operating  
10 license termination dates?

11

12 A. The following future dollar cost estimates are based on the Company's  
13 November 1987 Inflation Rate Forecast. For each of the Company's four  
14 nuclear units the current license expiration date and the total estimated future  
15 cost of decommissioning is given below.

16

17	<u>UNIT</u>	<u>LICENSE EXPIRATION</u>	<u>EST. FUTURE COST</u>
18	St. Lucie No. 1	March 1, 2016	\$1,370,729,178
19	St. Lucie No. 2	April 6, 2023	1,473,080,158
20	Turkey Point No. 3	April 27, 2007	503,344,063
21	Turkey Point No. 4	April 27, 2007	621,942,760

22

23 These estimated future costs apply only to the decommissioning methodology  
24 selected by the Company for each of its two plants; Mothball/Prompt-Integrated  
25 Station Dismantling for St. Lucie Unit Nos. 1 and 2, and Integrated Prompt

1           **Removal/Dismantling for Turkey Point Unit Nos. 3 and 4.**

2

3           **The estimated future costs for St. Lucie Unit No. 2 include the obligations of**  
4           **the Orlando Utilities Commission and the Florida Municipal Power Agency**  
5           **which own 6.08951% and 8.806% of the Unit respectively.**

6

7   **Q.   As presently planned, in which years will the funds accumulated in the Nuclear**  
8           **Decommissioning Trust Fund be expended for each unit?**

9

10   **A.   The years in which funds are to be expended by the Company to meet the**  
11           **estimated costs of decommissioning each of the four nuclear units is given**  
12           **below.**

13

<u>Unit</u>	<u>Year(s) of Fund Expenditures</u>
14 <b>St. Lucie No. 1</b>	2014 - 2028
15 <b>St. Lucie No. 2</b>	2021 - 2028
16 <b>Turkey Point No. 3</b>	2005 - 2013
17 <b>Turkey Point No. 4</b>	2005 - 2014

18

19

20           **The timing of fund expenditures for each unit is based on the Engineering Cost**  
21           **Study performed for the Company by TLG Engineering, Inc. and the**  
22           **decommissioning methodology selected by the Company for each of its four**  
23           **units. The greater number of years over which funds will be expended for St.**  
24           **Lucie Unit No. 1 versus those of Unit No. 2 is attributable to the difference in**  
25           **the operating license expiration date for the units. Because the operating license**

1 of St. Lucie Unit No. 1 is currently expected to expire approximately seven years  
2 prior to that of St. Lucie Unit No. 2, fund expenditures are made for activities  
3 which enable Unit No. 1 to remain dormant until the license expiration of St.  
4 Lucie Unit No. 2. Upon License expiration of St. Lucie Unit No. 2, both Units  
5 will be decommissioned together on an integrated basis. Because there is no  
6 difference in license expiration dates for the Turkey Point Units, expenditures  
7 are made over approximately the same period of time.

1 Q. What is the estimated future cost of decommissioning by unit in each year in  
2 which decommissioning funds will be expended?

3

4 For each of the Company's four nuclear units the estimated future cost of  
5 decommissioning for each year in which funds are expended, is given below.

6

7 Turkey Point Plant

8 Integrated Prompt Removal/Dismantling

9

10	Year of	Estimated Future Cost	
	<u>Decommissioning</u>	<u>Unit No. 3</u>	<u>Unit No. 4</u>
11	2005	\$ 1,115,261	\$ 611,541
12	2006	4,757,530	2,662,549
13	2007	30,421,764	22,037,228
14	2008	94,863,296	32,891,160
15	2009	126,463,249	110,230,751
16	2010	133,292,265	146,870,251
17	2011	67,745,350	154,801,245
18	2012	33,067,696	86,896,867
19	2013	11,617,652	51,398,161
20	2014	_____	<u>13,543,007</u>
21	Totals	<u>\$503,344,063</u>	<u>\$621,942,760</u>

1 St. Lucie Plant			
2 Mothball/Prompt - Integrated Dismantling			
3	Year of	Estimated Future Cost	
4	<u>Decommissioning</u>	<u>Unit No. 1</u>	<u>Unit No. 2</u>
5	2014	\$ 1,852,197	
6	2015	7,299,018	
7	2016	78,763,017	
8	2017	28,331,287	
9	2018	12,680,922	
10	2019	13,378,372	
11	2020	14,114,183	
12	2021	14,890,463	\$ 1,276,476
13	2022	76,534,689	5,333,059
14	2023	262,488,312	61,780,306
15	2024	287,329,270	272,605,419
16	2025	303,132,380	353,445,292
17	2026	134,676,440	372,531,338
18	2027	124,327,707	232,741,082
19	2028	<u>10,930,921</u>	<u>173,367,186</u>
20	Totals	<u>\$1,370,729,178</u>	<u>\$1,473,080,158</u>

1 Q. What are the annual accruals and revenue requirements in equal dollar amounts  
2 necessary to recover future decommissioning costs, net of tax, over the remaining  
3 life for each of the Company's nuclear power units?

4  
5 A. The following jurisdictional annual accruals and revenue requirements are  
6 needed to meet the estimated costs of decommissioning. These amounts are  
7 based on the Company's estimates of 1988 decommissioning costs and the  
8 November 1987 Inflation Rate Forecast which assumed an estimated  
9 decommissioning fund after-tax earning rate of 5.6%.

10  
11

<u>Unit</u>	<u>Annual Accrual</u>	<u>Annual Revenue Requirements</u>
12 St. Lucie No. 1	\$ 9,923,209	\$10,114,432
13 St. Lucie No. 2	8,092,801	8,248,752
14 Turkey Point No. 3	9,243,243	9,421,363
15 Turkey point No. 4	<u>12,628,212</u>	<u>12,871,562</u>
16 Total	<u>\$39,887,465</u>	<u>\$40,656,109</u>

17

18 The annual accruals and revenue requirements are assumed to be collected  
19 equally over the remaining operating life of each unit, beginning January 1,  
20 1989. The annual accruals through the currently estimated remaining life of  
21 these units are amounts which will be needed to cover the currently estimated  
22 jurisdictional costs of decommissioning each of the four units. Because the  
23 Company is obligated to pay Regulatory Assessment Fees (0.125%) and Gross  
24 Receipts Tax (1.5%) along with a provision which must be made for

1           **Uncollectible Accounts (0.2656%) on its total revenues, the above annual revenue**  
2           **requirements exceed the accruals. An increase in the Regulatory Assessment Fee**  
3           **from 0.0833% to 0.125% which became effective January 1, 1989 was approved**  
4           **by the Commission at an Agenda Conference in November, 1988. As a result,**  
5           **the above revenue requirements differ from those submitted in our 1988**  
6           **Decommissioning Cost Studies.**

7  
8           **The annual revenue requirements above, represent an increase of \$21,471,337**  
9           **over the Company's current revenue requirements of \$19,184,772 as established**  
10           **in previous Commission Orders.**

11  
12       **Q.    What method is currently used by the Company to fund for decommissioning**  
13           **costs?**

14  
15       **A.    Prior to Internal Revenue Service (IRS) Code Section 468A which provided for**  
16           **the establishment of qualified funds, the Company made contributions to a non-**  
17           **qualified fund. Contributions to the non-qualified fund were to be used to**  
18           **meet the cost of decommissioning all of the Company's nuclear units. The IRS**  
19           **Code which now provides for the establishment of qualified funding**  
20           **arrangements enable the Company to make an annual election to make either**  
21           **qualified or non-qualified contributions to the fund(s). Unlike the non-**  
22           **qualified fund, contributions to a qualified fund must be used to meet the costs**  
23           **of decommissioning a specific nuclear unit. Mr. Kuberek, in his testimony,**  
24           **discusses the regulations which govern qualified funding elections by the**  
25           **Company.**

1 Contributions to the qualified fund are made to an external trustee, State Street  
 2 Bank & Trust Company (State Street), Boston, Massachusetts. State Street acts  
 3 as a trustee for the qualified fund and has certain responsibilities to ensure that  
 4 the qualified funds are in compliance with the requirements of Section 468A  
 5 of the IRS Code and the terms and conditions of the Trust Agreement. In  
 6 addition, State Street also provides custodial services to the Company as they  
 7 relate to the qualified funds.

8  
 9 Contributions made to the non-qualified fund are also made to State Street,  
 10 which also serves as Trustee for the non-qualified fund. State Street's  
 11 responsibilities as Trustee for the non-qualified fund are not as broad as those  
 12 required for the qualified fund. The Trustee has additional responsibility with  
 13 respect to the qualified fund to ensure compliance with IRS Code Section 468A.  
 14 The Company continues to control the selection of the investments for both the  
 15 qualified and non-qualified funds.

16  
 17 As of December 31, 1988 the differences between actual fund balances and  
 18 those which were projected in the Decommissioning Studies follow:

	Projected	Actual	Difference
	<u>(000's)</u>	<u>(000's)</u>	<u>(000's)</u>
21 Qualified	\$ 69,609	\$ 78,067	\$ (8,458)
22 Non-Qualified	<u>61,956</u>	<u>22,129</u>	<u>39,827</u>
23 Combined	<u>\$131,565</u>	<u>\$100,196</u>	<u>\$ 31,369</u>

1 The differences between actual and projected fund balances are attributable  
2 to:

3 \$ 26.7 million Federal income tax refund receivable for tax years 1984  
4 through 1986.  
5 1.4 million projected earnings on the Federal income tax receivable.  
6 1.7 million current and future State income tax adjustments (or  
7 deductions).  
8 0.1 million projected earnings on 1988 State income tax adjustment.  
9 1.4 million market value versus book value.  
10 \$ 31.3 million variance

11  
12 For purposes of projecting decommissioning fund balances for year-end 1988 it  
13 was assumed in our Decommissioning Studies that the federal income tax  
14 refunds associated with Qualified Funding elections for years 1984 through 1986  
15 had been received. To date, these refunds have not been received.  
16 Consequently, the above variance is largely due to timing differences.

17  
18 The above State income tax adjustments are those attributable to making  
19 qualified funding elections for tax years 1984 through 1986. Because there is  
20 no actual State income tax refund associated with having made qualified  
21 funding elections for these years, the term "adjustment" is used to describe the  
22 fact that the Company takes a deduction on its State income taxes for purposes  
23 of realizing the amount attributable to qualified funding elections for years  
24 1984 through 1986. A detailed explanation of the analytical treatment of the  
25 State income tax adjustments was provided in the 1988 Decommissioning Studies

1 filed with the Commission. The assumed earnings rate on Federal and State  
2 income tax refunds/adjustments is 5.6%.

3  
4 Q. What are the costs associated with the trustee services and portfolio management  
5 of the Company's nuclear decommissioning fund?

6  
7 A. The fees payable to the trustee, State Street, are assessed on a sliding scale based  
8 on the market value of the securities being held and are paid by the Fund. The  
9 current fee schedule is as follows:

10		
11	First \$5 million	1/5th of 1%
12	Next \$10 million	1/10th of 1%
13	Next \$15 million	1/20th of 1%
14	Next \$20 million	1/30th of 1%
15	Over \$50 million	1/50th of 1%

16  
17 In addition, nominal transaction and accounting fees are charged.

18  
19 State Street was chosen as Trustee for the Fund because of their commitment  
20 to trust business, a high level of automation, technical sophistication and a  
21 competitive fee structure for services provided.

22  
23 The management of the Fund's assets is presently performed by staff within the  
24 Finance Department. There are no plans to incur the additional cost of outside  
25 managers unless it could be demonstrated that an outside manager would

1 provide an incremental return with an equivalent level of investment safety.  
2 The Company's pension consultants estimate that the Fund would incur an  
3 additional annual cost of between 25 to 50 basis points if outside managers  
4 were to be utilized.

5  
6 Q. What is the investment strategy for the Company's Nuclear Decommissioning  
7 Fund?

8  
9 A. The primary objective of the fund is to provide the capital necessary for the  
10 decommissioning of the Company's nuclear power plants at the end of their  
11 respective licensing periods. To accomplish this, the strategy is to maximize the  
12 earnings growth of the portfolio while maintaining a high degree of safety so  
13 as to minimize future customer contributions. Safety will be increased through  
14 the use of fixed income investments, with quality controls and diversification  
15 guidelines used to manage credit risk. The higher after-tax returns from  
16 investments in municipal securities further strengthens the portfolio in meeting  
17 its funding objective.

18  
19 In January 1988, the Company's nuclear decommissioning fund was separated  
20 into two components, non-qualified and qualified. A qualified fund was  
21 established to realize the tax benefits offered in Section 468A of the IRS Code.  
22 Meeting the requirements of Section 468A requires the assets of the qualified  
23 fund to be invested in assets as defined in the "Black Lung Act", which are  
24 public debt securities of the United States, obligations of state or local  
25 governments or time or demand deposits. The monies remaining in the non-

1 qualified fund are not subject to regulatory restriction.

2  
3 The ability of a decommissioning fund to meet its future liabilities is based on  
4 the accuracy of cost estimates and the accompanying rate of inflation. Because  
5 inflation will play such an important role in meeting the future obligation of  
6 a decommissioning fund, the Company hopes to achieve a real return on the  
7 fund greater than the rate of inflation. To accomplish this, a decommissioning  
8 fund should pursue an investment strategy that is sensitive to change in the  
9 environment related to decommissioning costs, technology, regulation and  
10 financial market volatility. This means pursuing a course that diversifies  
11 market risk over time rather than matching all investment maturities with each  
12 plant's expected license expiration date. Because the Decommissioning Fund is  
13 a taxable entity, at the existing corporate tax rate of 34%, tax-exempt municipal  
14 securities provide the greatest economic benefit for both the qualified and non-  
15 qualified portfolios. Since establishing the reserve in 1983, the Company has  
16 pursued a strategy of using tax-advantaged fixed income instruments, namely,  
17 municipal bonds and preferred stock. Municipal bonds have consistently  
18 provided a higher after-tax benefit to the Fund than alternative taxable  
19 securities. During 1988 the average after-tax yield "pick-up" on new purchases  
20 of municipal bonds over U.S. Treasury Securities issued with comparable  
21 maturities was approximately 140 basis points.

22  
23 Preferred stock has been an attractive investment from time to time because  
24 of the Dividends Received Deduction (DRD) to institutional investors. High  
25 quality sinking fund preferred stock has been used extensively in what is now

1 labeled the non-qualified fund but has lost some of its appeal due to the  
 2 reduction of the DRD to 70% from 85% and the general lack of supply of high  
 3 quality issues.

4  
 5 Q. What is the asset structure of the decommissioning portfolios and what has been  
 6 the historical investment performance?

7  
 8 A. On December 31, 1988 the asset mix of the decommissioning fund was as  
 9 follows:

	Non-Qualified	Qualified	Combined
	<u>(000's)</u>	<u>(000's)</u>	<u>(000's)</u>
12 Cash & Equivalents	\$ 274	\$ 1,195	\$ 1,469
13 Municipal Bonds	20,040	76,872	96,912
14 Preferred Stock	<u>1,815</u>	<u>-0-</u>	<u>1,815</u>
15 Total	<u>\$22,129</u>	<u>\$78,067</u>	<u>\$100,196</u>

16  
 17 The historical investment performance as of December 31, 1988 is as follows:

	<u>After-Tax Time Weighted Rates of Return</u>			
	Past	Past	Past	Since
	<u>1 Year</u>	<u>2 Years</u>	<u>3 Years</u>	<u>Inception</u>
22 Combined Fund	3.6%	3.1%	5.6%	8.0%

1 Q. How was the Company's 5.6% earning rate computed?

2  
3 A. Since earnings of the decommissioning funds are taxable, the funds receive the  
4 greatest benefit from tax free municipal bonds. An analysis of historical  
5 municipal bond yields was performed. Thirty-eight years of Moody's "Aa" 10  
6 and 20 year municipal bond yields were examined and compared to the  
7 Consumer Price Index (CPI) for a like period. To smooth out the effects of  
8 market distortion, 30 year moving averages were calculated for both maturities.  
9 The 30 year moving average yield spread to CPI for the 10 year "Aa" municipal  
10 was calculated to be a negative 8 basis points. For the 20 year "Aa" municipal  
11 the spread was a positive 50 basis points. The average earnings rate was derived  
12 by weighting the average yield spreads to CPI of the 10 and 20 year "Aa"  
13 municipal bonds. By assuming a 50/50 weighting of the two spreads the  
14 following results were obtained:

Municipal	Average 30	Assumed	Weighted Average
<u>Bond</u>	<u>Year Spread</u>	<u>Weighting</u>	<u>30 Year Spread</u>
	<u>Over/Under CPI</u>		<u>Over/Under CPI</u>
10 Year	-0.08%	50%	-0.04%
20 Year	0.50%	50%	+0.25%
			+0.21%

1 By adding the weighted average yield spread above to the CPI as forecasted by  
2 the Company, an after-tax earnings rate was derived.

3	4	5	6
7	8	9	10
11	12	13	14
15	16	17	18
19	20	21	22
23	24	25	

Company's Long Term Average CPI <u>Forecast</u>	Weighted Average <u>Spread Over CPI</u>	Assumed Earnings <u>Rate Forecast</u>
5.4%	0.21%	5.61%

9 Since the assumed earnings rate is tied to the Company's forecast of the CPI this  
10 rate will be subject to change from time to time. As previously mentioned an  
11 updated Inflation Rate Forecast is expected to be completed in May 1989 which  
12 may impact the earnings rate forecast.

13  
14  
15 Q. Why does the Company feel this rate is appropriate?

16  
17 A. Based on the taxability of the decommissioning fund, it was determined that the  
18 most meaningful proxy for future earnings growth would be to compare  
19 historical long term municipal bond yields against CPI. This long term look at  
20 historical municipal bond yields gives a good picture of the trend of bond yields  
21 during periods of both very low and high periods of inflation and the effects  
22 that the "oil shock" of the 1970's had on the market. This demonstrates that over  
23 long periods of time it is difficult to beat inflation.

24  
25 Because of the limited and erratic supply of high grade preferred stock issues,

1 it would be inappropriate to make an assumption that these higher yielding  
2 securities make up a significant part of the asset mix in the future and  
3 therefore, impact the Company's earnings rate assumption.

4  
5 Total return measures include any unrealized appreciation or depreciation of  
6 a security which will vary with market fluctuations. This is particularly useful  
7 for securities which do not have a final maturity such as common stocks. Since  
8 the decommissioning fund is generally comprised of fixed income instruments  
9 which have a stated maturity and will be used to eventually fund a liability  
10 with a known payout date, it was determined that it will be the earnings cash  
11 flow and the compounding of those earnings that will provide the dollars  
12 required rather than price appreciation. For instance, assume a portfolio was  
13 to purchase a \$1 million, 20 year bond at par, with a 5.6% coupon and that the  
14 reinvestment rate on the coupon payments is also 5.6%. Over the life of this  
15 bond the interest earned on interest represents over 40% of the total income. It  
16 is this income flow and accumulation of the reinvestment of that income that  
17 will finally determine the ability of the Fund to meet its obligation and  
18 therefore, was the determining factor in selecting this methodology. The  
19 Company's investment strategy has generally been one which focuses on long-  
20 term earnings accumulation, rather than one which attempts to capitalize on  
21 short-term price differentials between securities.

1 Q. How often should contributions be made to the Company's Decommissioning  
2 Fund?

3  
4 A. The Company bills its customers for service provided on a monthly basis. A  
5 portion of the costs recovered in a billing cycle are considered costs associated  
6 with nuclear plant decommissioning. In that the costs are recovered by the  
7 Company on a monthly basis, monthly contributions to the fund are considered  
8 to be most appropriate. The current Decommissioning Studies assume that fund  
9 contributions and earnings are applied on a monthly basis.

10  
11 Q. Mr. Hoffman, does this conclude your testimony?

12  
13 A. Yes, it does.

G. G. KUBEREX

**BEFORE THE FLORIDA PUBLIC SERVICE COMMISSION**

**FLORIDA POWER & LIGHT COMPANY**

**TESTIMONY OF**

**GARY G. KUBEREK**

**DOCKET NO. 870098-EI**

**FEBRUARY 27, 1989**

1 Q. Please state your name and business address.

2

3 A. My name is Gary G. Kuberek and my business address is 9250  
4 West Flagler Street, Miami, Florida 33174.

5

6 Q. By whom are you employed and in what capacity?

7

8 A. I am employed by Florida Power & Light Company (the  
9 Company) as Assistant Comptroller Corporate Tax.

10

11 Q. Please describe your educational background and business  
12 experience.

13

14 A. I am a graduate of the University of Tennessee with a  
15 Bachelor of Science degree in Business Administration,  
16 with a major in accounting. In addition, I have completed  
17 the Executive Program in Business Administration at  
18 Columbia University. I was employed by the Company in

1 1972 and have worked in its Accounting Department since  
2 that time. I have held various technical and managerial  
3 positions with the Company, including Tax Analyst, Manager  
4 of Corporate Tax, Assistant Comptroller and Manager of  
5 Corporate Tax; Assistant Comptroller and Director of  
6 Corporate Taxes and Property Accounting and my present  
7 position, Assistant Comptroller Corporate Tax. I was  
8 Chairman of the Edison Electric Institute Taxation  
9 Committee for the fiscal year 1982-1983. Before joining  
10 the Company, I held various positions with the Internal  
11 Revenue Service.  
12

13 Q. Will you please describe your duties as Assistant  
14 Comptroller Corporate Tax?  
15

16 A. As Assistant Comptroller Corporate Tax, I am responsible  
17 for directing the Company-wide functions concerning taxes  
18 and providing tax policy guidelines to all levels of the  
19 organization. In addition, I am responsible for advising  
20 management of the effect of taxes on business decisions.  
21

22 Q. What is the purpose of your testimony in this proceeding?  
23

24 A. The purpose of my testimony in this proceeding is to  
25 explain the Company's accounting treatment for nuclear

1 decommissioning costs included in the Company's cost of  
2 service and significant changes in regulations occurring  
3 subsequent to the Company's last decommissioning hearing.  
4

5 Q. How are nuclear decommissioning costs accounted for in the  
6 Company's books and records?  
7

8 A. In compliance with Order No. 10987, Docket No. 810100-EU,  
9 issued July 13, 1982, the Company recovers the estimated  
10 nuclear decommissioning costs over the remaining life of  
11 the nuclear unit. The nuclear decommissioning costs are  
12 recorded as a separate expense in sub-account 403,  
13 Depreciation Expense. The related decommissioning  
14 reserves are also segregated within the accumulated  
15 provision for depreciation. Revenues collected associated  
16 with nuclear decommissioning costs are deposited in the  
17 funds on a monthly basis.  
18

19 Q. Are the parties owning an interest in the nuclear units  
20 of the Company required to provide for their proportionate  
21 share of the total decommissioning costs?  
22

23 A. Yes. The participation agreements are associated with St.  
24 Lucie Unit No. 2 and are between the Company and Florida  
25 Municipal Power Agency (FMPA) and Orlando Utilities

1 Commission (OUC), respectively. These agreements state  
2 that the participants shall make funds "available for  
3 payment of decommissioning (and disposal) costs on the  
4 same basis and with the same priority as (those) provided  
5 by the Company". Excerpts from the FMPA and OUC  
6 agreements are included in my Document No. 1.  
7

8 Q. Based upon the Company's previously approved study, what  
9 are the annual amounts included in cost of service for  
10 nuclear decommissioning?  
11

12 A. The annual amounts previously approved by the Commission  
13 and required for nuclear decommissioning are as follows:

	<u>Total Company</u>	<u>Jurisdictional</u>
Turkey Point Unit No. 3	\$ 5,504,080	\$5,355,895
Turkey Point Unit No. 4	4,022,756	3,914,544
St. Lucie Unit No. 1	5,019,875	4,884,338
St. Lucie Unit No. 2	4,796,115	4,667,100

19  
20 Q. Based on the Company's petition in this proceeding, what  
21 are the annual amounts required to be included in the  
22 Company's cost of service?  
23

24 A. The annual amounts required for nuclear decommissioning  
25 as filed in the Company's petition are as follows:

	<u>Total Company</u>	<u>Jurisdictional</u>
1		
2	Turkey Point Unit No. 3	\$ 9,412,479
3	Turkey Point Unit No. 4	12,859,425
4	St. Lucie Unit No. 1	10,104,895
5	St. Lucie Unit No. 2	8,240,974
6		8,092,801

7 Q. What is the projected date that each nuclear unit will no  
8 longer be included in rate base for ratemaking purposes?

9  
10 A. For purposes of the present decommissioning filing, the  
11 Company projected that the nuclear units would be retired  
12 and removed from rate base for ratemaking purposes as  
13 follows:

14	Turkey Point Unit No. 3	April 27, 2007
15	Turkey Point Unit No. 4	April 27, 2007
16	St. Lucie Unit No. 1	March 1, 2016
17	St. Lucie Unit No. 2	April 6, 2023

18  
19 Q. Have any laws been enacted or regulations been issued  
20 since the last decommissioning hearing which have a  
21 significant affect on nuclear decommissioning as discussed  
22 in your testimony?

23  
24 A. Yes. Section 468A of the Internal Revenue Code was added  
25 by the Tax Reform Act of 1984 providing for an annual

1 election to make a tax deductible contribution to a  
2 qualified nuclear decommissioning fund if certain  
3 conditions are met.  
4

5 In 1986, the Treasury Department issued Temporary  
6 Regulations under Section 468A. The Temporary Regulations  
7 provided transition rules which allowed a tax deduction  
8 for cash payments to a qualified nuclear decommissioning  
9 fund for tax years 1984 through 1986. The final  
10 regulations were issued in March 1988.  
11

12 On June 27, 1988, the Nuclear Regulatory Commission (NRC)  
13 issued a final rule amending its regulations, to be  
14 effective July 27, 1988, requiring that financial  
15 assurance be provided so funds will be available for  
16 decommissioning nuclear units. This assurance must be  
17 demonstrated by one of the following methods: 1)  
18 Prepayment prior to the start of operation; 2) External  
19 sinking fund, or 3) A surety method, insurance or other  
20 guarantee method. Under the prepayment or sinking fund  
21 methods, the NRC would require that funds for nuclear  
22 decommissioning be segregated from the licensee's other  
23 assets and outside the licensee's administrative control.  
24 In addition, the NRC rules require utilities with  
25 pressurized water reactor units to set aside certain

1 minimum decommissioning funds based on megawatt thermal  
2 capacity. Under this rule, the Company would be required  
3 to provide a minimum of approximately \$95 million per unit  
4 at Turkey Point and approximately \$100 million per unit  
5 at St. Lucie (in 1986 dollars). These NRC estimates do  
6 not include costs to ship spent fuel and demolish non-  
7 radioactive structures, as the NRC does not consider these  
8 decommissioning activities. These amendments to the  
9 regulations effectively require a utility with an  
10 ownership interest in a nuclear unit to establish an  
11 external fund to provide for decommissioning of the  
12 nuclear unit.

13  
14 In order to meet the conditions of Section 468A of the  
15 Internal Revenue Code and to comply with NRC requirements,  
16 the Company determined that the current arrangement,  
17 placing nuclear decommissioning funds with a trustee was  
18 required. This arrangement also complies with Order No.  
19 10987 which states that "decommissioning cost of nuclear  
20 generating units shall be funded by use of a funded  
21 reserve".

22  
23 Q. What is a qualified nuclear decommissioning fund?

24  
25 A. A qualified nuclear decommissioning fund is a fund

1 established to meet the requirements of Section 468A of  
2 the Internal Revenue Code.

3

4 Q. What is the purpose of establishing a qualified fund?

5

6 A. The purpose of establishing a qualified fund is to permit  
7 the Company the opportunity to make an election to take  
8 a tax deduction for cash payments to a nuclear  
9 decommissioning fund. In the absence of an election under  
10 Section 468A of the Internal Revenue Code, payments to a  
11 nuclear decommissioning fund are not tax deductible until  
12 economic performance, i.e. actual decommissioning, occurs.

13

14 Q. What are the major requirements under Section 468A of the  
15 Internal Revenue Code for obtaining a tax deduction for  
16 a payment to a nuclear decommissioning fund?

17

18 A. The major requirements which must be met under Section  
19 468A of the Internal Revenue Code in order to obtain a tax  
20 deduction are:

21

22 1. The taxpayer must receive a ruling from the Internal  
23 Revenue Service approving the schedule of amounts  
24 (ruling amount) applicable to the nuclear  
25 decommissioning fund;

- 1           2.    The payments to the fund must be included in cost of  
2           service for ratemaking purposes.    However, such  
3           amount is limited to the ruling amount for tax  
4           deduction purposes;  
5  
6           3.    The taxpayer must establish a nuclear decommissioning  
7           trust fund for each unit; and  
8  
9           4.    The fund investments must be limited to those  
10          enumerated in Section 468A of the Internal Revenue  
11          Code.

12  
13           In my Document 2, I have included selected pages from the  
14           executive summary of the Company's filing which explains  
15           in more detail the requirements, the tax consequences and  
16           advantages and disadvantages of a qualified fund.

17  
18    Q.       Why did the Company elect to make contributions to  
19       qualified funds for years 1984 through 1987?

20  
21    A.       In Order No. 17467, Docket No. 870273-EI, issued on  
22       April 27, 1987, the Commission required the Company to  
23       file requests with the Internal Revenue Service seeking  
24       ruling amounts under Section 468A.  The Company filed its  
25       request for rulings on May 7, 1987 and was issued ruling

1 amounts for the Turkey Point Units in December 1987 and  
2 the St. Lucie Units in January 1988. Upon receiving these  
3 ruling amounts, the Company had thirty days to make  
4 deposits to qualified funds for years 1984 through 1986  
5 or lose the ability to make elections for such years.  
6 After giving consideration to the reduction in the  
7 corporate Federal income tax rate from 46% to 34%,  
8 effective July 1, 1987, the Company believed the  
9 advantages of the qualified fund outweighed the  
10 disadvantages for those years. The Company elected to make  
11 qualified contributions to nuclear decommissioning funds  
12 for tax years 1984 through 1986 and filed amended tax  
13 returns. Based on the previous analysis, the Company  
14 elected to make qualified contributions for 1987 in the  
15 original return as filed. The revenue requirements  
16 related to nuclear decommissioning determined in the  
17 Company's previous filing were premised upon a 46% Federal  
18 tax rate. With the lowering of the Federal tax rate to  
19 34%, the Company incurred a projected deficiency in its  
20 funding. In fact, the annual revenue requirements  
21 requested under the petition as filed would have been  
22 higher had the Company not made these elections.

23  
24 Q. Should the Company be required to elect qualified nuclear  
25 decommissioning contributions in the future?

1 A. No. While the required contribution must be funded each  
2 year, the Company decides whether to make contributions  
3 to either the qualified or nonqualified nuclear  
4 decommissioning fund based on the current facts and  
5 circumstances applicable to the Company. If the  
6 Commission were to require the Company to elect and make  
7 contributions to the qualified funds, it would take away  
8 the Company's ability to adapt to changes in circumstances  
9 in the future that might produce lower revenue  
10 requirements for our customers. By prescribing taxpayer  
11 elections, the Commission would impede the ability of the  
12 Company to avail itself of the most cost effective  
13 strategy and, therefore, i would strongly recommend  
14 against setting such a precedent.

15  
16 Q. Does the Company believe its current filing will provide  
17 the funds necessary to decommission its nuclear units  
18 based on the current decommissioning study performed by  
19 TLG Engineering, Inc. and the cost escalation and  
20 inflation rates supported by the Company?

21  
22 A. Yes. The Company believes that based on the current  
23 decommissioning study performed by TLG Engineering, Inc.,  
24 and the cost escalation and inflation rates supported by  
25 the Company, the recovery of decommissioning costs set

1           forth in its petition will be sufficient to decommission  
2           the nuclear units upon termination of their licenses.  
3

4   Q.       Should the dismantlement of nuclear non-contaminated plant  
5           components be included in the funding for nuclear  
6           decommissioning, or recovered separately through  
7           depreciation based on the lives and costs specifically  
8           related to those nuclear non-contaminated reusable  
9           components?

10  
11   A.       At this time, the dismantlement of the nuclear non-  
12           contaminated plant components is and should be included  
13           in the funding for nuclear decommissioning. If the  
14           nuclear non-contaminated portion of the unit is retired  
15           at the same time as the nuclear portion, there would be  
16           no significant difference in total costs since such costs  
17           have not been considered in current depreciation studies  
18           and removal of such costs from the decommissioning study  
19           would cause an offsetting deficiency in depreciation  
20           reserves. If, however, at a future time, the nuclear non-  
21           contaminated portion is determined to have a useful life  
22           beyond the nuclear portion, it may be preferable to  
23           recover the related removal costs as a component of  
24           depreciation to more closely associate these costs with  
25           each unit's period of generation.

1 Q. Should a decommissioning cost study be required from the  
2 Company addressing the exclusion of nuclear non-  
3 contaminated components and facilities which can be used  
4 for generation of power subsequent to decommissioning of  
5 the present nuclear components?  
6

7 A. Currently, as discussed by Company witness, Mr. Denis,  
8 it does not appear that there is any basis to conclude  
9 that nuclear non-contaminated components will have any  
10 significant value upon decommissioning. If it can later  
11 be established that the nuclear non-contaminated  
12 components and facilities have a useful life beyond the  
13 nuclear facilities, a cost study should be required and  
14 the removal cost of the nuclear non-contaminated portion  
15 would be spread over the extended period the unit would  
16 provide generation. Since this is not presently the case,  
17 no change to the study filed in the Company's petition  
18 should be made.  
19

20 Q. If a decommissioning cost study is required addressing the  
21 exclusion of nuclear non-contaminated components and  
22 facilities, in what time frame should it be required?  
23

24 A. If the Commission decides it is in the ratepayers' best  
25 interest to separate the nuclear non-contaminated portion

1           from the decommissioning study, I recommend that the  
2           proper time to incorporate this change would be in the  
3           Company's next decommissioning study.

4

5   Q.       Does this conclude your testimony?

6

7   A.       Yes, it does.

**SECTION 18 - Decommissioning and Disposal**

Company in its sole discretion shall have the authority to determine at any time when the Estimated Useful Life or Economic Life of St. Lucie Unit No. 2 has ended and thereupon to retire St. Lucie Unit No. 2. Company shall exercise said discretion in good faith. Thereupon, Company may take such action, on behalf of all Owners, as may be necessary to terminate operation and to place St. Lucie Unit No. 2 in a safe shutdown condition, and further may, in its sole discretion, decommission and dispose of and thereafter maintain St. Lucie Unit No. 2. Company shall have sole responsibility for, and is fully authorized to act on behalf of Participant with respect to termination of operation, decommissioning, disposal and subsequent maintenance of St. Lucie Unit No. 2 (including all related waste products and materials). Each Owner shall be responsible for its Ownership Percentage of all costs incurred in connection therewith (in accordance with Section 6), and shall be entitled to its Ownership Percentage of the salvage value of St. Lucie Unit No. 2. The provisions of this Section 18 are subject to the limited option provided in Section 20.

**SECTION 19 - Provision for Decommissioning Costs**

Beginning with Firm Operation, Company intends to provide for decommissioning and disposal costs through including in its depreciation rates and charges a negative salvage value applicable to St. Lucie Unit No. 2. Participant shall provide through its depreciation rates or through charges to its members or from other cash sources a provision for

decommissioning and disposal costs based on Participant's Ownership Percentage no less at any time than that accumulated by Company in its depreciation rates or through other charges as reported to or ordered by the Federal Energy Regulatory Commission or its successor based on Company's Ownership Percentage. If Company, by its own decision or by order of any governmental authority, provides at any time a fund or other security for decommissioning and/or disposal of St. Lucie Unit No. 2, Participant shall contribute to such fund or other security in proportion to its Ownership Percentage or establish a separate fund or security in proportion to its Ownership Percentage of such decommissioning and/or disposal costs which fund or security shall be available for the payment of decommissioning and disposal costs with no less priority than the fund provided by Company.

**DECOMMISSIONING  
FUNDING ALTERNATIVES  
QUALIFIED vs. NONQUALIFIED**

**Qualified Decommissioning Fund**

Section 468A of the Internal Revenue Code (Code) provides for an annual election for contributions to a qualified fund. Listed below are the requirements imposed by the Code and Treasury Regulations which must be met to secure the tax deduction as well as the tax consequences of utilizing a qualified decommissioning fund:

**Requirements:**

1. In requesting and obtaining a schedule of ruling amounts:
  - (a) The Internal Revenue Service (IRS) will not provide a schedule of ruling amounts until a public utility commission (1) has determined the amount of decommissioning costs to be included in the taxpayers' cost of service, and (2) has disclosed the after tax return and any other assumptions used in establishing or approving such amounts for taxable years beginning on or after January 1, 1987.
  - (b) A request for an initial or revised schedule of ruling amounts must be filed with the IRS on or before the "deemed payment deadline date" of the first taxable year to which the schedule of ruling amounts will apply, i.e. March 15 of the succeeding taxable year for calendar year taxpayers.

**DECOMMISSIONING  
FUNDING ALTERNATIVES  
QUALIFIED vs. NONQUALIFIED (Cont'd)**

**Requirements:** (Cont'd)

2. The maximum amount which can be contributed to a qualified nuclear decommissioning fund cannot exceed the lesser of:
  - (a) The amount of nuclear decommissioning costs included in the cost of service for a taxable year (to the extent such costs are directly or indirectly charged to customers of the taxpayer by reason of electric energy consumed during such taxable year or are otherwise required to be included in the taxpayer's income); or
  - (b) The applicable ruling amount for that year. The taxpayer must secure a schedule of ruling amounts from the IRS that will generally be determined on the same basis as that used for regulatory purposes, except that the ruling amount may not exceed the amount necessary to fund that portion of nuclear decommissioning costs which bears the same ratio to the total nuclear decommissioning costs as the period for which the qualified fund is in effect bears to the estimated useful life of the nuclear unit.
3. The assets held by a qualified fund can be invested only in the following types of securities:
  - (a) Public debt securities of the United States.
  - (b) Tax-exempt obligations of a state or local government that are not in default as to principal or interest; or
  - (c) Time or demand deposits in a bank or insured credit union located in the United States.
4. A separate qualified decommissioning fund must be established for each nuclear unit. The fund must be maintained at all times in the United States pursuant to an arrangement that qualifies as a trust under state law and must be established for the exclusive purpose of providing funds for decommissioning.

**DECOMMISSIONING  
FUNDING ALTERNATIVES  
QUALIFIED vs. NONQUALIFIED (Cont'd)**

**Tax Consequences**

5. The tax effects of making an election under Code Section 468A are:
- (a) Contributions to the fund are deductible as long as they are paid to the fund by the "deemed payment deadline date", i.e. March 15 of the succeeding tax year for calendar year taxpayers;
  - (b) All distributions from the fund are included in the taxable income of the electing taxpayer with the exception of direct payments of administrative costs and other incidental expenses of the fund;
  - (c) In substance the Code allows a deduction in the year of decommissioning only to the extent that decommissioning expenses exceed the amount distributed from the qualified fund for decommissioning expenses; and
  - (d) Contrary to the tax law in general, the taxpayer receives no deduction for decommissioning expenses paid with earnings of the qualified fund.
6. The tax effects on the qualified decommissioning fund are:
- (a) Contributions are not taxable to the fund;
  - (b) Earnings of the fund are taxable at the highest corporate rate in effect for the tax year in which the earnings accrue; and
  - (c) Administrative expenses paid by the qualified decommissioning fund (other than an amount paid to the electing taxpayer) are deductible by the fund.

**DECOMMISSIONING  
FUNDING ALTERNATIVES  
QUALIFIED vs. NONQUALIFIED (Cont'd)**

**Advantages of a Qualified Fund**

The two primary benefits of a qualified decommissioning fund are the increased revenue requirement stability and increased security of the fund.

**Stability**

Increased stability is provided over the remaining life of the plant, including the period of decommissioning. This increased stability is a result of the leveled IRS method of funding whereby the effect of tax changes are leveled and no particular vintage of customer gets a windfall or detriment solely due to the timing of tax rate changes.

**Security**

Increased security of funds is provided, since contributions to a qualified decommissioning fund cannot be used for any purpose other than decommissioning and the fund is limited in the nature of investments permitted. This insures that the funds are used only for the reason they were intended and not used for any other purpose.

**Disadvantages of a Qualified Fund**

The primary disadvantage of a qualified fund is its inflexibility as evidenced by the inability to transfer over or underfunded amounts to other units, the limits on the maximum amount which can be funded and the restrictions on investment alternatives.

**Transfers**

The inability to transfer dollars between funds is the most serious problem since it removes the ability to make up a shortfall in one fund with an overage in another fund.

**DECOMMISSIONING**  
**FUNDING ALTERNATIVES**  
**QUALIFIED vs. NONQUALIFIED** (Cont'd)

**Disadvantages of a Qualified Fund** (Cont'd)

**Contribution Limits**

The limit on the amount which can be contributed to a qualified fund each year makes it impossible to realize the tax advantages of the qualified fund for all amounts collected. Any portion of the amounts collected attributable to nonqualified decommissioning costs cannot be contributed to a qualified fund. In addition, any amounts contributed to a qualified fund are limited to the amounts collected based on energy consumed during the taxable year in question.

**Investment Alternative Limits**

The limits on investment alternatives could be a disadvantage in times when other financial alternatives would be more attractive.

T. S. LAGUARDIA

BEFORE THE FLORIDA PUBLIC SERVICE COMMISSION

FLORIDA POWER & LIGHT COMPANY

TESTIMONY OF

THOMAS S. LAGUARDIA

DOCKET NO. 870098-EI

FEBRUARY 27, 1989

1 Q. Please state your name and address.

2

3 A. Thomas S. LaGuardia, 148 New Milford Road East, Bridgewater,  
4 CT 06752.

5

6 Q. By whom are you employed and in what capacity?

7

8 A. I am President of TLG Engineering, Inc (TLG Engineering).

9

10 Q. What are your responsibilities within that organization?

11

12 A. I am responsible for the technical and business management of  
13 the engineering consulting services in the areas of  
14 decontamination, decommissioning, waste management and general  
15 engineering for nuclear and fossil fueled generating stations.

16

17 Q. Please outline your educational qualifications and experience.

1 A. I completed my BSME at Polytechnic Institute of Brooklyn in  
2 1962 and my MSME at the University of Connecticut in 1968.  
3 I am a registered professional engineer in Connecticut (No.  
4 10393) and New York (No. 059389). I founded TLG Engineering  
5 in April, 1982. I was employed by Nuclear Energy Services in  
6 Danbury, Connecticut from 1973 until I founded TLG  
7 Engineering. Prior employment was with Gulf Nuclear Fuels  
8 Corporation (formerly United Nuclear Corporation (UNC)) and  
9 Combustion Engineering.

10  
11 Q. What is your experience relating to decommissioning?  
12

13 A. My decommissioning experience began as site representative for  
14 UNC during the BONUS reactor decommissioning in 1969 and 1970.  
15 BONUS was a 17 MWe demonstration power reactor and the largest  
16 reactor decommissioned by entombment up to that time. The  
17 program involved extensive chemical decontamination of  
18 radioactive systems, selective piping and component removal,  
19 and entombment of the reactor vessel within a massive concrete  
20 barrier. The entombment has a design life of 125 years. My  
21 role as site representative was to act as a technical liaison  
22 and provide project engineering and schedule management  
23 assistance during system decontamination, component removal,  
24 vessel entombment and facility closeout.

1 Following the BONUS program, I was lead engineer for UNC  
2 during the Elk River Reactor decommissioning between 1970 -  
3 1974. Elk River was a 20 MWe demonstration power reactor that  
4 was decommissioned by complete dismantlement. The program  
5 involved segmentation of the reactor vessel and internals  
6 using remotely operated cutting torches, as well as the  
7 packaging, shipping and controlled burial of the segments.

8  
9 Similarly, radioactive piping and components were removed,  
10 packaged, shipped and buried. Radioactive concrete was  
11 demolished by controlled blasting, and nonradioactive concrete  
12 demolished by wrecking ball to completely dismantle the  
13 facility. Initially, my role for UNC was consulting engineer  
14 and later lead engineer for UNC technical support for on-site  
15 activities.

16  
17 I was Project Engineer for the detailed engineering and  
18 planning of the Shippingport Station Decommissioning Project  
19 from 1979 - 1982. Shippingport was a 72 MWe light water  
20 breeder reactor. The facility is now almost completely  
21 dismantled, and TLG, with its joint venture partner Cleveland  
22 Wrecking Company, dismantled all of the piping and components  
23 and removing contaminated concrete. My role for TLG/Cleveland  
24 was Project Director, and I selected and managed an on-site  
25 project management team to hire and supervise work crews to

1 accomplish the dismantling. Our work is complete and was  
2 performed on schedule and within budget.

3  
4 I also assisted Atomic Energy of Canada, Ltd. in the detailed  
5 engineering and planning of the 238 MWe Gentilly Unit 1  
6 reactor. My role was to provide overall decommissioning  
7 consulting services and detailed cost estimation of  
8 alternatives.

9  
10 Q. What studies or reports have you prepared or co-authored on  
11 decommissioning cost estimating and technology?

12  
13 A. While at Nuclear Energy Services, I was principal investigator  
14 for the Atomic Industrial Forum decommissioning study entitled  
15 "An Engineering Evaluation of Nuclear Power Reactor  
16 Decommissioning Alternatives" (AIF/NESP-009). This study  
17 evaluated the costs, schedule and environmental impacts of  
18 decommissioning 1100 MWe reactors (Pressurized Water Reactors  
19 [PWRs], Boiling Water Reactors [BWRs], and High Temperature  
20 Gas Reactors [HTGRs]).

21  
22 I also co-authored the "Decommissioning Handbook" for the U.S.  
23 Department of Energy (DOE). The Handbook reported the state  
24 of the art in decommissioning technology (as of 1980),  
25 including decontamination, piping and component removal,

1 vessel segmentation, concrete demolition, cost estimating and  
2 environmental impacts.

3  
4 At TLG Engineering, I co-authored "Guidelines for Producing  
5 Commercial Nuclear Power Plant Decommissioning Cost Estimates"  
6 (AIF/NESP-036) for the Atomic Industrial Forum, National  
7 Environmental Studies Project. The Guidelines identify the  
8 elements of costs to be included in the estimation of  
9 decommissioning activities for each of the principal  
10 decommissioning alternatives. Specific guidance in cost  
11 estimating methodology and reference cost data is provided in  
12 this study. The major objective of this study is to provide  
13 a basis for consistent cost estimating methodology.

14  
15 TLG Engineering also prepared a study entitled,  
16 "Identification and Evaluation of Facilitation Techniques for  
17 Decommissioning Light Water Power Reactors" (NUREG/CR-3587)  
18 for the Nuclear Regulatory Commission (NRC). The study  
19 evaluated the costs and benefits of techniques to reduce  
20 occupational exposure and waste volume from decommissioning.  
21 TLG Engineering has prepared site-specific decommissioning  
22 studies for most of the nuclear units in the United States and  
23 21 fossil-fueled power plants. In addition, TLG prepared the  
24 Decommissioning Plan and Environmental Report (ER) for Dresden  
25 Unit 1, and the ER for Indian Point Unit 1.

1 Q. What is the purpose of your testimony?

2

3 A. I am presenting the results of the 1987 decommissioning cost  
4 studies prepared under my direction and supervision for the  
5 St. Lucie Nuclear Unit Nos. 1 & 2 and the Turkey Point Unit  
6 Nos. 3 & 4. This study was commissioned by the Florida Power  
7 & Light Company (Company) as owner and operator of the  
8 stations. My testimony includes the decommissioning  
9 alternatives evaluated, cost and schedule estimates, and a  
10 discussion of decommissioning feasibility.

11

12 Q. What is the purpose of the decommissioning studies?

13

14 A. The purpose was to estimate the cost of decommissioning the  
15 two nuclear sites so that the contributions required to  
16 establish a decommissioning fund can be determined. The study  
17 is not a detailed decommissioning engineering plan, and  
18 therefore, does not commit the participants to a specific  
19 course of action for the station following ultimate plant  
20 shutdown.

21

22 Q. What are the costs of each decommissioning alternative?

23

24 A. The costs for each decommissioning alternative are shown in  
25 my Documents 1 and 2, for the St. Lucie nuclear station and

1 the Turkey Point nuclear station, respectively. Each  
2 decommissioning scenario involved one or a combination of the  
3 three accepted decommissioning alternatives; DECON, ENTOMB and  
4 SAFSTOR. The costs associated with each of the alternatives  
5 are reported in constant 1987 dollars and include 25%  
6 contingency. The cost estimates do not include future  
7 inflation or consider the cost of money over the time period  
8 involved.

9  
10 Q. What decommissioning scenarios were considered for St. Lucie  
11 station?

12  
13 A. Four scenarios were reviewed for the St. Lucie Station. The  
14 first scenario assumed that the two units on the site were  
15 decommissioned as they are taken out of service with no impact  
16 or interface with the adjacent unit. This is possible due to  
17 the differential in the issuance of the operating licenses  
18 1976 for Unit 1 and 1983 for Unit 2. The second scenario  
19 integrates the decommissioning by mothballing Unit No. 1 upon  
20 shutdown until such time that Unit No. 2 nears the cessation  
21 of operations. At this time a delayed dismantling program is  
22 initiated for Unit No. 1 such that the Unit No. 2 prompt  
23 decommissioning is properly sequenced. The final two  
24 scenarios involve standard mothball and entombment programs  
25 for the two units as they are retired. However, the dormancy

1 durations for Unit No. 2 have been shortened to approximately  
2 24 years such that the delayed dismantling program of the  
3 second unit can be integrated with that of Unit 1.  
4

5 Q. What are the costs of each decommissioning alternative  
6 considered at Turkey Point?  
7

8 A. My Document No. 2 provides the costs for each decommissioning  
9 alternative for the Turkey Point nuclear units. The operating  
10 licenses currently expire on the same date. Consequently,  
11 only three scenarios were costed. All three considered the  
12 integration of the decommissioning programs for the site as  
13 a whole. As a result the scheduling of the prompt removal  
14 program for Unit 4 and the dormancy periods for the delayed  
15 dismantling programs were adjusted such that decommissioning  
16 of the two units was integrated.  
17

18 Q. What is the basis for the decommissioning studies?  
19

20 A. The studies were developed using the detailed engineering  
21 drawings, together with plant description and inventory  
22 documents provided by the Company as owner and operator.  
23 These drawings and documents were used to identify the general  
24 arrangement of the facility and to determine estimates of  
25 building concrete volumes, steel quantities, numbers and size

1 of components and degree of site restoration required.

2  
3 I personally made a site inspection of the plant, including  
4 access to the facility to determine movement of heavy  
5 equipment (cranes, forklifts, front-end loaders) close to the  
6 structures for demolition and removal work.

7 Decommissioning is a labor-intensive program. Representative  
8 labor rates for each geographical region and each craft or  
9 salaried work group are essential for development of a  
10 meaningful site-specific decommissioning cost estimate.  
11 Accordingly, the Company provided typical craft labor rates  
12 and utility salary data.

13  
14 Rates for shipping radioactive wastes for burial were obtained  
15 from tariffs published by Tri-State Motor Transit. Tri-State  
16 Motor Transit is a reputable carrier with many years of  
17 experience in handling radioactive fuel and low level  
18 radioactive wastes. Transportation costs are an important  
19 element of decommissioning costs and recent rates must be used  
20 for accurate site-specific cost estimates. For this study,  
21 we assumed all low-level radioactive waste would be shipped  
22 to a hypothetical regional burial ground within 500 miles of  
23 the St. Lucie site and 600 miles from Turkey Point. For cost  
24 estimating purposes, the burial costs for radioactive  
25 materials were developed using the rate schedule of an

1 existing disposal facility, i.e. the Barnwell Low-Level  
2 Radioactive Waste Management Facility.

3  
4 Q. Are there any federal regulations governing nuclear  
5 decommissioning?

6  
7 A. Yes. The United States NRC has regulations dealing with the  
8 issue of decommissioning. These regulations are identified  
9 in Title 10 of the US Code of Federal Regulations (CFR) Parts  
10 20, 30, 40, 50, 51, 70, and 72, and specific guidance for  
11 their implementation is provided in NRC Regulatory Guide 1.86  
12 (June, 1974).

13  
14 The NRC published the Final Rule entitled "General  
15 Requirements for Decommissioning Nuclear Facilities" in the  
16 Federal Register of Monday, June 27, 1988 to establish  
17 technical and financial criteria for decommissioning licensed  
18 facilities. As discussed later the new NRC Rule recognizes  
19 the advantages of a site-specific cost estimate for  
20 decommissioning funding, and recommends that decommissioning  
21 be accomplished in the shortest practical time following  
22 cessation of operations. The decommissioning cost estimates  
23 prepared for the St. Lucie and Turkey Point nuclear units  
24 fully satisfy each issue of this new regulation.

25 Q. What methodology was used to prepare the cost estimate in your

1 studies?

2  
3 A. The methodology used to develop the cost estimate followed the  
4 basic approach presented in the AIF/NESP-036 study report,  
5 "Guidelines for Producing Commercial Nuclear Power Plant  
6 Decommissioning Cost Estimates", and the U.S. DOE  
7 "Decommissioning Handbook".

8  
9 These references use a unit cost factor method for estimating  
10 decommissioning activity costs to standardize the estimating  
11 calculations. Unit cost factors for activities such as  
12 concrete removal (\$/cu yd), steel removal (\$/ton), and cutting  
13 costs (\$/in.) were developed from the labor and material  
14 information provided by the Company. With the item quantity  
15 (cu yds, tons, inches, etc.) developed from plant drawings and  
16 inventory documents, the activity-dependent costs for  
17 decontamination, removal, packaging, shipping and burial were  
18 estimated. The activity duration critical path derived from  
19 such key activities, e.g. the disposition of the Nuclear Steam  
20 Supply System (NSSS), was used to determine the total  
21 decommissioning program schedule.

22  
23 The program schedule is used to determine the period-dependent  
24 costs such as program management, administration, field  
25 engineering, equipment rental, quality assurance and security.

1 The salary and hourly rates are typical for personnel  
2 associated with period-dependent costs. The costs for  
3 conventional demolition of non-radioactive structures,  
4 materials, backfill, landscaping and equipment rental were  
5 obtained from conventional demolition references such as R.  
6 S. Means, "Building Construction Cost Data 1987".

7  
8 In addition, collateral costs were included for heavy  
9 equipment rental or purchase, safety equipment and supplies,  
10 energy costs, permits, taxes, and insurance.

11  
12 The activity-dependent, period-dependent, and collateral costs  
13 were added to develop the total decommissioning costs. A 25%  
14 contingency was added to allow for the effect of unpredictable  
15 program problems on costs. Such a contingency is appropriate  
16 for a project of this size and type, as will be discussed  
17 later in this testimony.

18  
19 One of the primary objectives of every decommissioning program  
20 is to protect public health and safety. The cost estimates  
21 for the St. Lucie and Turkey Point decommissioning activities  
22 include the necessary planning, engineering and implementation  
23 to provide this protection to the public.

24  
25 Q. Have you considered the removal of spent fuel in your cost

1 estimate?

2

3 A. No. It is important to note that although decommissioning of  
4 a site cannot be complete without the removal of all spent  
5 fuel and source material, the disposition of high-level waste  
6 is outside the scope of decommissioning. In accordance with  
7 the Nuclear Waste Policy Act of 1982 (Public Law 94-425), the  
8 DOE is required by law to enter into contracts with owners  
9 and/or generators of spent fuel, with the DOE responsible for  
10 final dispositions of spent fuel as high-level nuclear waste.  
11 To cover the cost of spent fuel disposition, the DOE assesses  
12 the facility operator 1 mill/kWh on net electrical generation.  
13 Therefore, the cost and disposal of spent fuel is accounted  
14 for separately and is specifically excluded from the  
15 decommissioning estimates.

16

17 All radioactive wastes generated during the decommissioning  
18 process are low-level radioactive wastes and will be  
19 transported to a federal or state licensed commercial low-  
20 level waste facility for ultimate disposal, as required by the  
21 appropriate regulations in effect at the time of  
22 decommissioning.

23

24 Q. What decommissioning alternatives were considered in preparing  
25 the cost estimates?

1 A. Estimates were prepared addressing the three basic  
2 decommissioning alternatives: (1) DECON (prompt  
3 removal/dismantling), (2) ENTOMB (safe storage entombment with  
4 delayed dismantling), and (3) SAFSTOR (safe storage  
5 mothballing with delayed dismantling). These alternatives may  
6 be briefly summarized as follows:

7  
8 1) The DECON (prompt removal/dismantling) alternative  
9 consists of removing from the site the spent fuel  
10 assemblies discharged from the reactor and stored on  
11 site. Note that the cost associated with the disposition  
12 of fuel and source material is not included in this  
13 estimate. All radioactive wastes from plant operation  
14 would be packaged and shipped for controlled burial. The  
15 operating license would be converted to a possession-only  
16 license for the decommissioning operations. A  
17 possession-only license permits the owner to possess the  
18 radioactive material under reduced Technical  
19 Specification requirements, but prohibits operation of  
20 the reactor. The radioactive fission and corrosion  
21 products and all other radioactive materials having  
22 activities above accepted unrestricted levels would be  
23 removed, packaged and shipped for disposal. The site may  
24 then be released following NRC approval, for unrestricted  
25 use with no requirement for a license. The remainder of

1 the reactor facility could then be dismantled to make the  
2 site available for alternative use.

3  
4 2) The ENTOMB (safe storage entombment) alternative consists  
5 of removing from the site all fuel and radioactive wastes  
6 from operations. The cost for disposal of fuel is not  
7 included in this decommissioning estimate as discussed  
8 in the previous alternative. A possession-only license  
9 would be obtained, selected radioactive material would  
10 be removed from the site, and all remaining radioactivity  
11 would be sealed within an entombment barrier. A remotely  
12 monitored security intrusion system would be put in  
13 operation, and periodic surveillance, inspections and  
14 continuing facility repairs and maintenance would be  
15 provided to ensure entombment integrity. Following a  
16 dormancy period, the plant would be  
17 decontaminated/dismantled as described in the DECON  
18 alternative.

19  
20 3) SAFSTOR (Safe storage mothballing) consists of the same  
21 basic site deactivation activities as carried out in the  
22 entombment method except that radioactive components are  
23 neither shipped off-site nor centrally stored within an  
24 entombment barrier. Piping and components would be  
25 drained and dried, and left on site. An adequate

1 security force would remain on the site, thereby  
2 increasing the annual maintenance costs when compared  
3 with entombment. As with the entombment, the  
4 decontamination/dismantling activities are delayed to a  
5 later date.  
6

7 Q. Does the NRC have a requirement as to completion of  
8 decommissioning?  
9

10 A. Yes. The NRC has stated that for an electric utility  
11 licensee, an alternative is acceptable if it provides for  
12 completion of decommissioning within 60 years. Consideration  
13 will be given to an alternative which provides for completion  
14 of decommissioning beyond 60 years only when necessary to  
15 protect the public health and safety.  
16

17 Q. What is your recommended scenario for each of the Company's  
18 nuclear sites?  
19

20 A. I recommend that the Company, for planning purposes, have  
21 their funding determined based upon the following  
22 decommissioning scenarios: placing St. Lucie Unit 1 into  
23 SAFSTOR for a period of approximately 5 years at which time  
24 decommissioning activities could commence in conjunction with  
25 Unit 2; decommissioning the two Turkey Point nuclear units

1 upon final shutdown, i.e. an integrated DECON scenario.

2 These alternatives provide the most reasonable means for  
3 terminating the license for the site in the shortest possible  
4 time, and consequently relieves the Company of its regulatory  
5 and liability obligations at the site. Furthermore, this  
6 scenario avoids the long-term costs and commitments associated  
7 with the maintenance, surveillance and security requirements  
8 of the conventional delayed dismantling alternatives, SAFSTOR  
9 and ENTOMB.

10  
11 The recommended alternatives also allow use of the plant's  
12 knowledgeable current operating staff, a valuable asset to a  
13 well managed, efficient decommissioning program. All  
14 equipment needed to support decommissioning operations such  
15 as cranes, ventilation systems and radwaste processing  
16 equipment would be fully operational. In addition, the site  
17 would be available for alternative uses in the near term.

18  
19 Q. When does actual decommissioning of a nuclear facility begin?

20  
21 A. Approximately two years prior to final shutdown, engineering  
22 and planning would begin on the preparation of the  
23 Decommissioning Engineering Plan and Environmental Assessment.  
24 The Plan describes the status of the facility at shutdown,  
25 work to be accomplished, safety analyses associated with each

1 of the major activities, general procedures and sequence to  
2 be followed, and final site condition upon completion of all  
3 work. Similarly, the environmental assessment would evaluate  
4 environmental effects (radiation exposure) to workers and the  
5 public, and waste generation effects on the site and  
6 environment. These documents would be submitted to the NRC  
7 and other regulatory agencies for review and approval, and  
8 authorization to proceed.  
9

10 Q. What are the various stages of decommissioning?  
11

12 A. Period 1 - Site Preparations - would begin upon shutdown of  
13 the facility, and would involve site preparations to initiate  
14 decommissioning. The operating license may be converted to  
15 a possession-only license which permits decommissioning  
16 activities to be performed, while reducing unnecessary  
17 Technical Specifications requirements associated with normal  
18 plant operations. All spent fuel would be removed from the  
19 reactor vessel and loaded into casks for transport to storage  
20 facilities on-site so as not to impact the decommissioning  
21 process. As noted earlier, fuel removal activities,  
22 packaging, shipping and disposal are not considered part of  
23 decommissioning and no costs are included in the  
24 decommissioning estimate for this work nor is any impact on  
25 decommissioning from the presence of such material on-site

1 considered or costed in the estimates. All fluids and wastes  
2 remaining from plant operations would be removed from the site  
3 and all systems nonessential to decommissioning would be  
4 isolated and drained. This work is expected to require  
5 approximately 12 months to accomplish.

6  
7 The following activities are performed both in the DECON  
8 alternative and in the delayed dismantling part of the SAFSTOR  
9 alternative. Consequently, both Period identifiers are shown,  
10 e.g. Period 2/4 indicated that the activities are applicable  
11 to both Period 2 of DECON (the first numerical identifier) and  
12 Period 4 of SAFSTOR. Period 2 of SAFSTOR is the dormancy  
13 phase, with Period 3 addressing site reactivation.

14  
15 Period 2/4 - Decommissioning Operations - would begin upon  
16 receipt of the dismantling order from the NRC. This phase of  
17 the work involves the removal of radioactivity from the site  
18 and termination of the license. The activities include  
19 selective decontamination of contaminated systems, e.g. using  
20 aggressive chemical solvents to dissolve corrosion films  
21 holding radionuclides, thereby reducing radiation levels.

22  
23 While effective, the decontamination processes are not  
24 expected to reduce residual radioactivity to the levels  
25 necessary to release the material as clean scrap. Therefore,

1 all contaminated components will have to be removed for  
2 controlled burial. However, decontamination will reduce  
3 personnel exposure and permit workers to operate in the  
4 immediate vicinity of most components, cutting and removing  
5 them for controlled disposition at a low-level waste burial  
6 facility.

7  
8 All piping to and from major components such as the steam  
9 generators will be cut and removed. The steam generators and  
10 other major components will be removed intact and sealed so  
11 that they may be shipped as their own containers for disposal.  
12 Smaller components will be loaded into containers and shipped  
13 for burial.

14  
15 The reactor vessel and its internals will be segmented into  
16 sections and remotely loaded into steel liners for transport  
17 to the burial facility in heavily shielded shipping casks.  
18 The reactor vessel and internals have sufficiently high  
19 radiation levels to require all cutting to be done underwater  
20 (to shield the workers), or behind heavy shields, using  
21 cutting torches operated by remote control.

22  
23 Concrete immediately surrounding the reactor vessel is  
24 expected to be radioactive (activated) and will be removed by  
25 controlled blasting. This blasting process is well developed

1 and safe and is the most effective way to remove the heavily-  
2 reinforced concrete from the structure. Sections of interior  
3 floors within areas of the containment and other buildings in  
4 the power block are expected to be surface contaminated from  
5 exposure to contaminated air/water as a result of plant  
6 operations. This contamination will be removed by  
7 scarification (surface removal) so the remaining surface will  
8 be clean and not require costly controlled burial. All  
9 contaminated process equipment, pipe hangars, supports and  
10 electrical components will be removed and disposed of by  
11 controlled burial. An extensive radiation survey will be  
12 performed to ensure all radioactivity above the levels  
13 specified has been removed from the site. The facility may  
14 then be released for unrestricted access. Once verified the  
15 NRC can then terminate the license for the site. This period  
16 is expected to require approximately three years to accomplish  
17 all activities.

18  
19 Period 3/5 - Dismantling of Remaining Structures - would  
20 involve the demolition of all remaining structures, typically  
21 to a depth of three feet below grade. Clean rubble would be  
22 used on-site for fill and additional soil would be used to  
23 cover each subgrade structure. The site would be graded.  
24 This period is expected to require approximately two years to  
25 accomplish all activities.

- 1 Q. What is the cost estimate validity and how is it applicable  
2 in the future?  
3
- 4 A. The cost estimates prepared for the St. Lucie and Turkey Point  
5 nuclear units are based on current state-of-art technology and  
6 on current federal regulations. No provision is made to  
7 include future costs (improvements in technology, major  
8 regulatory changes, inflation factors, etc.) to ensure there  
9 will be no double accounting for such factors when projecting  
10 costs to the expected date of decommissioning. It is my  
11 recommendation that the Company thoroughly review this  
12 estimate periodically and revise it, if necessary, to account  
13 for cost increases or decreases as influenced by future  
14 technology and regulations. It is my understanding that the  
15 Company intends to follow my recommendation.  
16
- 17 Q. Is there a contingency factor in your studies and, if so, how  
18 much is it?  
19
- 20 A. The contingency factor is 25%.  
21
- 22 Q. What is the purpose of the contingency?  
23
- 24 A. The purpose of the contingency is to allow for the costs of  
25 high probability program problems where the occurrence,

1 duration, and severity cannot be accurately predicted. The  
2 American Association of Cost Engineers (AACE) (in their cost  
3 Engineers Notebook) defines contingency as follows:  
4

5 Contingency - specific provision for unforeseeable  
6 elements of cost within the defined project scope;  
7 particularly important where previous experience relating  
8 estimates and actual costs has shown that unforeseeable  
9 events which will increase costs are likely to occur.

10  
11 Therefore, the objective of the contingency is to account for  
12 the costs of high probability program problems where the  
13 occurrence, duration, and severity cannot be accurately  
14 predicted and have not been included in the basic estimate.  
15 Past decommissioning experience has shown that these problems  
16 are likely to occur and may have a cumulative impact.

17  
18 A more extensive discussion of contingency is included in the  
19 AIF/NESP-036 Guidelines Study (Chapter 13) referred to  
20 earlier. In that study, we examined the major activity-  
21 related problems (decontamination, segmentation, equipment  
22 handling, packaging, shipping and burial) with respect to  
23 reasons for contingency. Individual activity contingencies  
24 ranged from 10% to 75%, depending on the degree of difficulty  
25 judged to be appropriate from our actual decommissioning

1        experience. The overall contingency, when applied to the  
2        appropriate components of a standard cost estimate, results  
3        in an average of approximately 25%. Therefore, we recommend  
4        that a 25% contingency be added to the total estimated costs  
5        for financial planning purposes.

6  
7        Q. Is there any other support for a contingency factor?

8  
9        A. Yes. Independent of our preparation of the AIF/NESP-036 study  
10       and its predecessor report, AIF/NESP-009, Battelle Pacific  
11       Northwest Labs prepared independent decommissioning cost  
12       estimates for the NRC for an 1175 MWe PWR (NUREG CR-0130) and  
13       an 1155 MWe BWR (NUREG CR-0672). Battelle concurred with the  
14       25% contingency allowance.

15  
16       Furthermore, the Federal Energy Regulatory Commission (FERC)  
17       adopted 25% contingency as reasonable, following the ruling  
18       of Judge Liebman in the Middle South Energy/Grand Gulf Case  
19       (Docket ER82-616), decision issued February 3, 1984. Numerous  
20       state public utility commissions have adopted 25% contingency,  
21       as evidenced by an American Gas Association Edison Electric  
22       Institute Depreciation Committee Survey which showed that at  
23       least 21 of 32 utility survey respondents had included 25%  
24       contingency in their estimates. Of the 15 utilities who filed  
25       rate cases, 11 had approval to use 25% contingency for their

1 plant decommissioning studies.

2  
3 Q. What is the basis of the feasibility of the decommissioning  
4 premise?

5  
6 A. There is extensive experience in the United States and in  
7 other countries for the complete dismantling of nuclear  
8 plants. This experience includes the chemical  
9 decontamination, component removal, packaging, shipping and  
10 burial, and building demolition. This directly related  
11 experience summarized herein is evidence that the Company's  
12 nuclear units can be completely dismantled.

13  
14 Between 1960 and 1979, 68 licensed nuclear reactors had been  
15 or were in the process of being decommissioned in the United  
16 States. Of these, five were nuclear power plants, four were  
17 demonstration nuclear power plants, six were licensed test  
18 reactors, 28 were research reactors. The remaining 25 were  
19 critical reactors and/or critical facilities decommissioned  
20 or scheduled to be decommissioned. They have been or will be  
21 totally dismantled, with their licenses terminated. Many  
22 other reactor facilities in the United States, Canada and  
23 Europe have been successfully decommissioned using  
24 demonstrated techniques. France decommissioned 13 reactors,  
25 Germany (FR) 6, Italy 8, Japan 7, Switzerland 2, United

1 Kingdom 5, and Canada 2.

2  
3 The feasibility of decommissioning in the United States is  
4 well documented in the successful dismantling of Shippingport  
5 Atomic Power Station, Elk River Reactor, Walter Reed Army  
6 Research Reactor, Ames Laboratory Reactor and Sodium Reactor  
7 Experiment (SRE) Facilities. Internationally, the  
8 decommissioning programs underway in England (Windscale  
9 Reactor), Germany, [FR] (Gundremmingen), and Japan (Japan  
10 Power Demonstration Reactor) are further evidence of  
11 demonstrated technology. The basic activities of cutting  
12 pipe, segmenting vessels, demolishing reinforced concrete and  
13 decontaminating contaminated systems and structures are  
14 independent of the size of the structure or megawatt rating  
15 of the plant on a unit cost factor basis (\$/cut, \$/cu yd,  
16 etc.). A contaminated 12-inch diameter pipe in a 3000 MWT  
17 plant takes as long to cut as it does in a 58 MWT plant,  
18 although the number of cuts will be greater in the larger  
19 plant. The technology of such cutting is well established.

20  
21 The major activities include removal and burial of  
22 contaminated piping and components using conventional power  
23 hack saws, oxyacetylene or plasma arc torches within a  
24 contamination control tent. Removal of the reactor vessel and  
25 internals can be accomplished using an arc-gouging fuel gas

1 torch or an arc saw which is currently capable of cutting  
2 through carbon and stainless steel up to 12 inches thick  
3 (current vessels are less than 10 inches thick). The remote  
4 manipulator technology required to cut the reactor vessel and  
5 internals was developed by Oak Ridge National Laboratory for  
6 the Elk River Reactor dismantling. This technology uses the  
7 plasma arc torch for cutting. This same tool was used in the  
8 SRE vessel cutting activity.  
9

10 Many of the tools and techniques used in decommissioning have  
11 been used in operating plants for maintenance and equipment  
12 replacement programs. This technology is, therefore, not  
13 unique and provides further evidence of the feasibility of  
14 decommissioning.  
15

16 In 1979, Virginia Electric and Power Company removed and  
17 replaced the contaminated 823 MWe steam generators in its  
18 Surry plants. The contaminated steam generators (measuring  
19 65 feet high by 170 inches outside diameter with 3.5 inch  
20 thick walls) each weighed 340 tons. The reactor coolant  
21 system stainless steel piping (34 inch inside diameter), steam  
22 piping (30 inch diameter) and feedwater piping (14 inch  
23 diameter) were cut with a plasma arc torch to isolate the  
24 steam generator from the primary and secondary systems.

1 The steam generator shell was circumferentially cut at the  
2 transition cone with the plasma arc torch. The two lower  
3 shell sections were removed through the existing equipment  
4 hatch for disposal. In 1981, a similar steam generator  
5 removal program was initiated and successfully performed by  
6 the Company at its Turkey Point Station.

7  
8 Controlled blasting concrete demolition methods are well  
9 developed. They have been used in the mining industry, and  
10 were successfully demonstrated in the demolition of the Elk  
11 River Reactor. Heavily reinforced eight feet thick concrete  
12 sections of the biological shield were safely removed with  
13 explosives, without damaging or interfering with the operation  
14 of adjacent operating power generating units. The successful  
15 application of these decommissioning techniques in both small  
16 and large nuclear power plants demonstrates assurance of  
17 decommissioning feasibility. Both the technology and the  
18 methodology for efficient decommissioning are available and  
19 fully tested.

20  
21 Q. What does the NRC's rule on decommissioning "General  
22 Requirements for Decommissioning Nuclear Facilities" as  
23 published in the Federal Register on Monday, June 27, 1988  
24 require?

1 A. The Rule, as published, requires licensees to assure the  
2 availability of funds by submitting a decommissioning funding  
3 plan. The Rule identifies the acceptable decommissioning  
4 alternatives I described earlier: DECON (prompt  
5 removal/dismantling), SAFSTOR (mothballing), and under special  
6 circumstances ENTOMB (entombment). Delayed decommissioning  
7 following initial mothballing or entombment activities should  
8 not exceed more than 60 years, unless it can be shown  
9 necessary to protect public health and safety. The Rule  
10 appears to discourage the ENTOMB alternative unless specific  
11 advantages can be shown. Both the DECON and SAFSTOR  
12 alternatives are considered reasonable options for  
13 decommissioning light water power reactors. The Rule also  
14 requires utilities to perform a periodic review of the funding  
15 plan over the life of the facility. TLG Engineering's site-  
16 specific cost estimate and decommissioning alternatives are  
17 formulated within the framework of the new NRC rule.

**Cost and Schedule Estimate Summary
