\* Have a good and cool weekend all :) \*

In accordance with the electronic filing procedures of the Florida Public Service Commission, the following filing is made:

a. The name, address, telephone number, and email address for the person responsible for this filing is:

**Stephanie Alexander, Esq.** Tripp Scott, PA

### **Tallahassee Office**

200 West College Avenue, Suite 216 Tallahassee, FL 32301 Tel: (850) 906-9100 Fax: (850) 906-9104

email:sda@trippscott.com http://www.trippscott.com

b. This filing is made in docket 090079-EI.

c. The document is being filed on behalf of the Association for Fairness in Rate Making ("AFFIRM").

d. The total number of pages in the document is 35 pages (including exhibits).

e. The attached document is AFFIRM's PostHearing Statement and Brief.

**Stephanie Alexander, Esq.** Tripp Scott, PA

### BEFORE THE FLORIDA PUBLIC SERVICE COMMISSION

In re: Petition for increase in rates by Progress DOCKET NO. 090079-EI Energy Florida, Inc. DATED: October 15, 2009

#### **POSTHEARING STATEMENT AND BRIEF OF AFFIRM**

Florida AFFIRM (the "Association for Fairness in Rate Making" or "AFFIRM") pursuant to the Prehearing Order No. 09-0190-PCO-EI in this docket and Order No. 09-00638-PHO-EI and Rule 28-106.215, Florida Administrative Code ("F.A.C."), hereby submits AFFIRM's Posthearing Statement of Issues and Positions and Brief.

#### **INTRODUCTION**

AFFIRM is a coalition of quick serve restaurants that have substantially similar electrical usage characteristics. The Members of AFFIRM are the corporations and corporations' franchisees that own and operate over 250 business locations served by the Company under the following brand names: Waffle House, Wendy's, Arby's, and YUM! Brands, doing business as Pizza Hut, KFC, Taco Bell, Long John Silver's and A&W.

The primary objective of AFFIRM's intervention in the subject base rate proceeding is to seek a more appropriately structured time of use rate for the AFFIRM Members that are served under the General Service Demand family of rates. PEF's GSDT-1, a time of use rate, is severely deficient in form and structure because the rate reflects only the most tenuous relationship between periodic pricing and related costs. Because of such deficiencies, the existing GSDT-1 Rate is unfair and unreasonable for further use, and should not be approved by the Commission until appropriate changes have been made to such rate.

Other objectives of AFFIRM's intervention in the subject base rate proceeding are (1) to propose the implementation of multi-location rates for application when there are numerous sites

> -1-10635 OCT I6 8 FPSC-COMMISSION CLERK

of the same customer taking electric service from the Company, and (2) to argue against PEF's proposed cost of service modification whereby fixed charges would be allocated on the basis of 12 Coincident Peak (CP) and 50% Average Demand (AD), versus the historical allocation method of 12 CP and 1/13<sup>th</sup> AD.

# AFFIRM'S BRIEF ON SPECIFIC COST OF SERVICE AND RATE DESIGN ISSUES

[Note: AFFIRM take no position on any issue other than Issues 90 and 107.]

**ISSUE 90:** What is the appropriate Cost of Service Methodology to be used to allocate base rate and cost recovery costs to the rate classes?

POSITION: \*12 CP and 1/13th Average Demand.\*

#### **DISCUSSION**

In this proceeding, the Company proposes that fixed production capacity costs should be allocated based on 12 CP and 50% AD rather than the historical allocation factor of 12 CP and 1/13<sup>th</sup> AD. AFFIRM objects to this proposed change in methodology. AFFIRM urges the Commission to reject the Company's proposal and instead to adopt the methodology that has historically been used.

The testimony of Company Witness Slusser advocates the use of the 12 CP and 50% AD methodology on the basis that it is intended to provide a better matching of allocation of costs and benefits to customer rate classes. Mr. Slusser argues that decisions regarding incremental expenditures for production capacity are now no longer driven by reliability issues but now are based on other concerns, most notably environmental compliance.

AFFIRM disagrees with Mr. Slusser and argues that the foremost responsibility of any franchised electric utility, including PEF, is to provide a safe and reliable electric supply at the

lowest cost consistent with good utility practice. The criteria for decisions regarding investment in production capacity have not changed, but rather reliability remains the primary criteria. Other considerations such as environmental compliance have become supplemental or secondary criteria, rather than the primary criteria suggested by Mr. Slusser.

The preponderance of PEF's existing fixed production capacity costs arise from decisions that were made during or before the Commission's adoption and application of the 12 CP and 1/13<sup>th</sup> AD methodology, and incremental additions to fixed production capacity costs continue to reflect the need to maintain a safe and reliable electric supply. For that reason, the Commission should mandate that fixed production capacity costs should continue to be allocated based on the historical methodology of 12 CP and 1/13<sup>th</sup> AD.

**ISSUE 107:** What is the appropriate method of designing time of use rates for PEF?

### **POSITION:**

\*The appropriate method of designing time of use rates is one that produces rates that (1) vary during different time periods and (2) reflect the variance, if any, in the utility's cost of generation and purchasing electricity at the wholesale level. Moreover, the design and implantation of the rate should enable the electric consumer to manage energy use and cost through advanced metering and communications technology.\*

#### **DISCUSSION**

To explain the deficiencies that exist in PEF GSDT-1 Rate, it is appropriate to: (1) examine the overriding objective of that rate; (2) evaluate the structure of that rate; and (3) then to compare the objective with the structure in order to ascertain whether such rate is effective in accomplishing the overriding objective.

### Overriding Objective of a Time of Use Rate

The direct testimony of AFFIRM Witness Russell L. Klepper cites the specific rate objective of the United States Congress, as set forth in the Energy Policy Act of 2005 ("EPAct")

which was enacted on August 8, 2005. Section 1252 of the EPAct amended the Public Utilities Regulatory Policy Act of 1978 ("PURPA") by adding language that provides, in relevant part, that each electric utility shall "provide individual customers upon customer request, a timebased rate schedule under which the rate charged by the electric utility varies during different time periods and reflects the variance, if any, in the utility's cost of generation and purchasing electricity at the wholesale level."

As required by the EPAct, the Commission was required to investigate and decide whether to require electric utilities to provide and install time-based meters and communication devices. In Docket No. 070022-EU, the Commission declined to adopt the standard established by EPAct. Pursuant to Order No. PSC-07-0212-PAA-EU issued March 7, 2007 (the "March 2007 Order"), at page 1, the Commission explained:

"We believe Section 1252 was intended to break down regulatory or institutional barriers to the provision of time sensitive rates. Based on our survey results, we find that Florida utilities, even those not subject to PURPA, have considered and implemented time sensitive rates and load management programs that comply with the spirit of Section 1252."

The March 2007 Order notes at page 3 that in 1981, the Commission had conducted proceedings to consider each PURPA raternaking standard and to determine whether each was appropriate for implementation in Florida. In Order No. 10179, issued August 31, 1981, the Commission determined that a modified version of the PURPA standard was appropriate. The Commission-approved standard (hereinafter, the "Commission TOU Standard") is:

"When such rates are cost-effective, the rates charged by an electric utility for each group of customers shall be time-differentiated in order to reflect the cost of providing service to such customers at different times of the day. "Cost-effective" means that the long run benefits to the utility and its customers exceed the cost of meters and other associated costs. Specific cost effectiveness methodologies may be prescribed by the Commission." The March 2007 Order includes as Attachment A the responses of certain regulated utilities, including PEF, to a survey performed by the Commission. At page 37 of Attachment A, in Item g, PEF sets forth its time of use rate goals (hereinafter, the "PEF TOU Goals") as follows:

"The goals of Rate Schedule GSDT-1 are demand savings, cost reductions, customer choice, price awareness, as well as the ability of the Company to improve overall system load factor."

#### Structure of Rates

PEF offers three primary rates for use by business customers. The first of these three is a non-demand rate that is available to only the smallest business customers, and the Members of AFFIRM do not qualify for this rate. The Members of AFFIRM qualify for service under both the General Service – Demand Rate (GSD-1) and the General Service – Demand (Optional TOU) Rate (GSDT-1).

The GSD-1 Rate is a "one size fits all" rate that does not effectively capture the beneficial electric load and usage characteristics of the Members of AFFIRM. Compared to most commercial and industrial customers of PEF, the Members of AFFIRM use a disproportionately lesser amount of energy during on-peak periods and a disproportionately greater amount of energy during off-peak periods. This is because quick serve restaurants have longer hours of operation that most business operations. Some of the restaurants are open around the clock, while others open early or remain open late at night.

The GSDT-1 Rate is a time-differentiated rate whereby there is a base demand charge and a separate on-peak demand charge. The same base and on-peak demand charges apply in both summer months (April through October) and winter months (November through March), and the on-peak hours are as described below. Pursuant to the GSDT-1 Rate, the same on-peak energy rate applies to all energy consumption during the defined on-peak periods in both the seven defined summer months and five defined winter months. During the summer months, the on-peak period is defined as the weekdays (except holidays) from noon to 9:00 PM. During the winter months, the on-peak period is defined as the weekdays (except holidays) from 6:00 AM to 10:00 AM and again from 6:00 PM to 10:00 PM.

Correspondingly, pursuant to the GSDT-1 Rate, the same off-peak energy rates applies to all energy consumption during the defined off-peak periods throughout the year. The off-peak periods consist of all hours during the year that are not defined as on-peak hours.

### Deficiencies of the GSDT-1 Rate

The focal questions in this matter are whether the GSDT-1 Rate satisfies either the Commission TOU Standard (time differentiated in order to reflect the cost of providing service to such customers at different times of the day) or the PEF TOU Goals (demand savings, cost reductions, customer choice, price awareness, and the ability of the Company to improve overall system load factors).

In order to determine whether the GSDT-1 Rate satisfies either the Commission TOU Standard or the PEF TOU Goals, AFFIRM examined hourly load data that was provided by PEF to AFFIRM for the years 2006, 2007 and 2008. Upon an analysis of this hourly system load data, it is clear that the existing GSDT-1 Rate is severely deficient because it does not effectively accomplish any of the goals that PEF set forth for such rate, nor does it comply with the Commission TOU Standard. The GSDT-1 Rate fails to satisfy these standards because the periodic pricing fails to reflect the basic utility principles that (a) incremental energy costs should be approximately equal for system loads of equal magnitude, regardless of when such loads occur, and (b) as system loads increase, incremental costs increase at an increasing rate, and

conversely, as system loads decrease, incremental costs decrease at a decreasing rate. As discussed in detail below, the manifestations of such deficiencies in the GSDT-1 Rate include:

- The structure and application of the Base Demand Rate and the On-Peak Demand Rate is not effective because it is based on the incorrect assumption that any customer's peak demand occurring during an on-peak period is a reasonable approximation of that customer's contribution to the Company's monthly peak demand.
- The arbitrary determination of the nine-hour duration of the summer on-peak period provides little economic incentive for any customer to shift load into a lower cost period.
- 3. The application of the same energy rate to all energy consumption during the ninehour duration of the summer peak period is unfair and unreasonable because the peak load is concentrated in the four-hour period from 2:00PM to 6:00 PM (the "critical peak period"), and because the materially lower load from noon to 2:00 PM and from 6:00 PM to 9:00 PM (the "shoulder period") results in a significantly lesser cost to PEF than the base energy costs during the critical peak period.
- 4. The application of the same energy rate to all energy consumption occurring during both the summer months and the winter months is unfair and unreasonable because the average energy consumption during the defined winter on-peaks hours is significantly lower than the average energy consumption during the defined summer on-peak hours. In fact, the average energy consumption during the defined winter onpeak hours is approximately equal to the average energy consumption during the defined summer off-peak hours.

5. The defined treatment of the period from 6:00 PM to 10:00 PM during the winter months provides an inappropriate incentive for customers to shift energy consumption out of a low use, low cost period.

The direct testimony of AFFIRM Witness Klepper, and AFFIRM's response to Item 1 of the Staff's First Request for Production of Documents both discuss the fact that the structure of both the GSD-1 and GSDT-1 Rates assumes that the individual monthly peaks of all customers contribute ratably to PEF's monthly system peaks. The peaks of the AFFIRM Members, while sometimes occurring during the defined on-peak hours and at other times occurring outside the defined on-peak hours, do not occur coincidentally with PEF's system peaks in any month. Accordingly, the AFFIRM Members are penalized, whether served under GSD-1 or GSDT-1, because the load shape of the AFFIRM Members is dissimilar to the load shape of the GSD-1 rate group as a whole.

Attached as Brief Exhibit 1 are seven pages, comprised of a table produced by PEF, three graphs for the summer months of 2006, 2007 and 2008, and three graphs for the winter months of 2006, 2007 and 2008 that illustrate PEF's system load shapes for the peak day during each month from January 2006 through and including December 2008. As can be seen from these graphs, the customer whose individual peak occurs during the shoulder period rather than during the critical peak period makes a disproportionately lesser contribution to the total system peak. This lesser contribution notwithstanding, that customer is charged as if it had made a proportionate contribution to the system peak.

As can be seen, customer peaks that do not occur during the PEF system peak do not contribute ratably to the costs of serving the system peak. The structure of the demand rate under the GSDT-1 rate is to have a charge for the peak occurring during the off peak hours, plus an additional charge for a customer peak occurring during the on-peak hours. By contrast, the

- 8 -

appropriate charge in this matter would be simply a demand charge based on the customer's contribution to the PEF system peak during the on-peak hours, and the on-peak hours should be redefined as the critical peak hours.

Attached as Brief Exhibit 2 are two pages, comprised of a table derived from and a corresponding bar chart, showing the average system load in megawatt-hours for each on-peak hour during the defined summer months of 2006, 2007 and 2008. As can be seen graphically, the system average energy consumption during the four critical peak hours from 2:00 PM to 6:00 PM is significantly higher (an average differential over the three year period of greater than 7%) than the system average energy consumption in the shoulder period from noon to 2:00 PM and from 6:00 PM to 9:00 PM.

Under the GSDT-1 Rate, PEF charges the same base energy charge for the entire defined nine hour period, even though the system average loads during the critical peak hours, and thus the non-fuel energy costs associated with the critical peak hours, are significantly higher than the system average loads and corresponding non-fuel energy costs during the shoulder hours. From this data, it is seen that the on-peak period, as currently defined, is overly broad and unfair to customers, such as the AFFIRM Members that consume a disproportionate percentage of onpeak energy during the shoulder hours rather than the critical peak hours. Based on this data, for purposes of the GSDT-1 Rate, the on-peak period during the summer should be redefined as the four hour period from 2:00 PM to 6:00 PM, and the prior two hours and subsequent three hours should be redefined as shoulder hours, with an appropriately lower base energy charge for the shoulder period.

Further, the fact that PEF offers only a single time of use price for energy consumption during such a broadly defined on-peak period is inconsistent with the Commission TOU Standard, which provides that rates should be established to reflect the costs of providing electric service at different times of the day. Moreover, the broadly defined on-peak period precludes fulfillment of the PEF TOU Goals, particularly the goal to improve the overall system load factor, as the overly broad on-peak period dampens the incentive to shift energy consumption from a high cost period to a low cost period.

Attached as Brief Exhibit 3 is five pages, comprised of a summer peak summary table and a winter peak summary table, both for 2006, 2007 and 2008, and page 401b – Monthly Peaks and Output from PEF's FERC Form No. 1 for each of 2006, 2007, and 2008. Brief Exhibit 3 reflects several important factors related to the structure of PEF's GSDT-1 Rate:

- As discussed above, it can be seen that although PEF currently defines its on-peak period as a nine-hour duration, there has been no monthly peak in a defined summer month during the past three years that occurred in any hour other than the hour ended 1600, 1700, or 1800.
- Three of the 21 monthly summer peaks (June 2006, May 2008 and October 2008) have occurred during defined off peak periods. Also, three of the 15 monthly winter peaks (February 2007, November 2007, and March 2008) have occurred during defined off-peak periods.
- The months of April and October reflects peaks that are on average only 76.3% and 82.8% of the annual summer peak loads, meaning that such monthly peaks are unlikely to place stress on PEF's generating system and that such months should not be treated as summer months.
- PEF's summer average monthly loads and average monthly peaks are significantly greater than the corresponding winter average monthly loads and average monthly peaks.
  Thus, the pricing for both demand and base energy should be differentiated between the summer months and the non-summer months.

- Twice in three years, PEF has experienced an annual system peak load during a winter month, but such peaks have occurred during the morning on-peak period and have been short-lived spikes in demand attributable to electric heating loads. When such annual peaks have occurred in a winter month, the peaks loads in the other four winter months during the same year have averaged less than 75% of the winter system peak, reinforcing the notion that winter usage is much lower than summer usage and pricing should be differentiated during the summer months versus the non-summer months.
- Five times in three years, PEF has experienced a winter monthly peak during the evening on-peak period, but such peaks have been so mild that the highest of the five winter monthly peaks has been only 70% of the annual summer peak during the same year. This means that the peaks occurring in the winter on-peak periods are unlikely to place stress on PEF's generating system. Accordingly, there is no compelling reason that energy consumption during evening hours in the winter months should be defined or priced as on-peak usage.

Attached as Brief Exhibit 4 is a single page entitled "Progress Energy Florida – Analysis of Hourly System Load Data", which analysis has been performed for 2006, 2007, and 2008. Brief Exhibit 4 reflects several important factors related to the structure of PEF's GSDT-1 Rate:

• Energy consumption during on-peak hours during both summer and winter months currently is priced the same under GSDT-1. However, PEF's average hourly system load during defined summer on-peaks hours is 42% higher than PEF's average hourly system load during defined winter on-peak periods. Because the winter on-peak loads are significantly less than the summer on-peak loads, PEF's costs per unit of energy for serving the on-peak winter loads would be lower than serving the on-peak summer loads, and the differences in costs of serving the winter versus summer on-peak loads should be

reflected through a correspondingly lower price for winter on-peak base energy than for summer on-peak base energy.

- Energy consumption during off-peak hours during both summer and winter months currently is priced the same under GSDT-1. However, PEF's average hourly system load during defined summer off-peaks hours is almost 20% higher than PEF's average hourly system load during defined winter off-peak periods. Because the winter off-peak loads are significantly less than the summer off-peak loads, PEF's costs per unit of energy for serving the off-peak winter loads would be lower than serving the off-peak summer loads, and the differences in costs of serving the winter versus summer off-peak loads should be reflected through a correspondingly lower price for winter off-peak base energy than for summer off-peak base energy.
- Under the GSDT-1 rate, energy consumption during the winter on-peak hours is significantly more expensive than energy consumption during the summer off-peak hours. Notwithstanding this significant pricing difference, PEF's average hourly load during PEF's defined winter on-peak periods (the more expensive period) is substantially similar to (or slightly lower than) PEF's defined summer off-peak periods (the less expensive period). However, the similarity in volume of the winter on-peak and summer off-peak loads means that the non-fuel energy costs incurred in serving each of these loads should be substantially similar, and the pricing for base energy for these periods should likewise be substantially similar.

In summary, the deficiencies in the design of PEF's existing GSDT-1 rate are numerous and extensive. PEF's prices set forth in the GSDT-1 Rate for the summer and winter on-peak periods bear almost no relationship to the costs that PEF is incurring to provide such loads during the corresponding periods. Most importantly, the pricing scheme embodied by PEF's GSD-1 Rate violates the existing Commission TOU Standard because such rate fails to properly or effectively differentiate its prices based on the costs of providing services at different times of the day or in different months. Further, the pricing scheme embodied by PEF's GSD-1 Rate fails to satisfy the PEF TOU Goals because such pricing does not allow for demand savings, cost reductions or customer choice, and particularly because such pricing does not provide the incentive for customers to respond to price signals in a manner that would lead to an improvement in the overall system load factor.

As discussed in detail in Item 2 of AFFIRM's response to Staff's First Set of Interrogatories, AFFIRM recommends the following modifications to PEF's existing GSDT-1 Rate:

1. The summer on-peak hours should be disaggregated into a redefined critical onpeak period (from 2:00 PM to 6:00 PM on weekdays excluding holidays) and a shoulder period (from noon to 2:00 PM and from 6:00 PM to 9:00 PM on weekdays excluding holidays).

2. The pricing for the summer critical peak and shoulder periods should be recalibrated to recognize the differences between non-fuel energy costs between the summer months and the winter months and between the critical peak hours and the shoulder hours.

3. The months of April and October should be reclassified as winter months.

4. The on-peak period in the winter months (as redefined to include April and October) should be re-defined to encompass only the hours of 6:00 AM to 10:00 AM,

- 13 -

with a corresponding change in non-fuel energy pricing to recognize the cost differences between summer and winter on-peak hours.

5. The off-peak period in the winter months (as redefined to include April and October) should be re-defined to include the hours of 6:00 PM to 10:00 PM, with a corresponding change in pricing to recognize inclusion of the new hours and the cost differences between summer and winter off-peak hours.

6. The measurement of, and charge for, the demand component in each month should be modified such that the billing demand in each month would be determined based on the customer's peak monthly demand occurring in, and only in, a defined peak period (the defined four hour on peak periods during the summer and winter months, as discussed above).

Under the current structure of the GSDT-1 Rate, the Members of AFFIRM are economically disadvantaged because their natural load shapes and other beneficial load characteristics are not manifested in the rates paid by such customers.

The modifications proposed above are appropriate because each such modification is intended to redesign the GSDT-1 Rate in a manner that the pricing in each hour of the year is more closely aligned with the hourly costs that result from the provision of electric service by PEF. The failure to adopt such modifications will result in the continuation of rates that are unfair, unjust and unreasonable because there is almost no relationship between the prices charged under this rate and the corresponding underlying costs. Further, the lack of relationship between prices set forth in the GSDT-1 Rate and underlying costs violates the Commission TOU Standard established in 1981 in Order No. 10179 issued August 31, 1981.

### The Appropriate Application of Multi-Location Rates

AFFIRM, through the direct testimony of Witness Klepper, has proposed that, in addition to the recommended modification to PEF GSDT-1 Rate, PEF should also be required to offer multi-location rates that would be available to customers who operate businesses under common ownership or control from more than one site. In particular, AFFIRM asserts that multi-location customers, such as the Members of AFFIRM, should benefit from the determination of peak monthly demand on an aggregated coincident basis, rather than having hundreds of business sites under common ownership and control paying for demand as the sum of the non-coincident loads of all such sites.

AFFIRM asserts that its Members are treated for ratemaking purposes as if they were hundreds of unaffiliated small retail customers. This treatment as individual customers is inconsistent with the collective manner in which the AFFIRM Members are treated in competitive markets by almost all energy suppliers, and is further inconsistent with the collective treatment that the AFFIRM Members enjoy from the suppliers of almost all products purchased by such companies.

In proposing that rate benefits should be available to multi-location customers, AFFIRM is aware of the existence of Commission Rule 25-6.102 F.A.C., which is a rule established by the Commission in 1969 precluding conjunctive billing and other similar billing schemes for multi-location customers. AFFIRM is also aware that multi-location rates are not contrary to law in Florida, and the rule established by the Commission forty years ago can be modified or rescinded by today's Commission. The preclusion against multi-location rates established under Commission Rule 25-6.102 was established at a time when the state of metering, telecommunications and computer technology were in their infancy compared to the technology available today.

- 15 -

It is important to note that the use of multiple location rates, conjunctive billing, aggregate billing or similar multiple location billing schemes has been authorized and implemented in other states, and AFFIRM is not aware of any court decision in which the use of such billing schemes has been found to be unfair, unreasonable, discriminatory or preferential.

### CONCLUSION

Based on the above discussion of the two rate structure issues and the deficiencies of PEF

current rate structures as applied to AFFIRM's members, AFFIRM respectfully that the requests that the Commission:

- 1. Order that the existing GSDT-1 Rate be modified in a manner that time differentiated prices for both demand charges and base energy charges should be re-established for both daily and seasonal periods, and should be implemented in a manner that will align, as closely as possible, periodic prices with the periodic costs that PEF is incurring to provide related electric service.
- 2. Order that multi-location rates be made available to electric customers who operate under common ownership or control, at least to the extent of allowing for conjunctive recognition for billing purposes of coincident peak demand for all sites under common ownership or control.
- 3. Order that fixed production capacity costs should continue to be allocated based on the historical methodology of 12 CP and 1/13<sup>th</sup> AD.

Respectfully submitted this 16<sup>th</sup> day of October 2009.

Notes:

1. Monthly peak occurred outside of the peak period defined in PEF tariff GSDT-1.

2. Data is from FERC Form 1 submittals by PEF.

Name of Respondent	This Report Is: (1) X An Original	Date of Report (Mo, Da, Yr)	Year/Period of Report End of 2006/Q4					
	(2) A Resubmission	12/31/2006						
MONTHLY PEAKS AND OUTPUT								

(1) Report the monthly peak load and energy output. If the respondent has two or more power which are not physically integrated, furnish the required information for each non- integrated system.

(2) Report on line 2 by month the system's output in Megawatt hours for each month.

(3) Report on line 3 by month the non-requirements sales for resale. Include in the monthly amounts any energy losses associated with the sales.

(4) Report on line 4 by month the system's monthly maximum megawatt load (60 minute integration) associated with the system.

(5) Report on lines 5 and 6 the specified information for each monthly peak load reported on line 4.

Docket 090079-EI AFFIRM BRIEF EXHIBIT 3 Page 3

Name of Respondent Florida Power Corporation	This Report Is: (1) X An Original (2) A Resubmission	Date of Report (Mo, Da, Yr) 12/31/2006	Year/Period of Report End of 2007/Q4				
MONTHLY PEAKS AND OUTPUT							

(1) Report the monthly peak load and energy output. If the respondent has two or more power which are not physically integrated, furnish the required information for each non- integrated system.

(2) Report on line 2 by month the system's output in Megawatt hours for each month.

(3) Report on line 3 by month the non-requirements sales for resale. Include in the monthly amounts any energy losses associated with the sales.

(4) Report on line 4 by month the system's monthly maximum megawatt load (60 minute integration) associated with the system.

(5) Report on lines 5 and 6 the specified information for each monthly peak load reported on line 4.

#### NAME OF SYSTEM:

Line			Monthly Non-Requirments Sales for Besale &	MONTHLY PEAK					
No.	Month	Total Monthly Energy	Associated Losses	Megawatts (See Instr. 4)	Day of Month	Hour
